Wrong agin. The best conditions for a Gel Cell are constant voltage float.
Constant trickle charge is used for NiCads! NiCads use constant trickle
charge because their charge state is not well related to their
terminal voltage. On a Gel Cell, the charge state is well correlated to
the terminal voltage, so a constant voltage float (with current limiting,
of course) is the best way to maintain their charge.

My company has industrial computers that have been in the field now for 10
years with Gel cells in a float configuration (NOT trickle charge). I was
involved in the design of this system and looked into Gel Cell behavior
in detail.

For those interested, Gates publishes a nice battery applications manual that
discusses Gel Cells and Nicads, in great detail. Their phone number
is 303-744-4806.

Andy
I haven't built and compared the penny feed with the pyramidal horn feeds I generally use myself but from I read, the penny feed isn't a particularly stellar performer.
Your dish is pretty close to the F/D of the dish I used in the Dec. '89 HR article and the pyramidal feed for that antenna should perform well for you. Dimensions and construction details for this feed are also in the 1991 ARRL Handbook.
If you are a purist, I can probably dig up some design data to allow you to build a fairly optimum feed for your particular F/D but I think you'll find that the horn works very well and is not difficult to construct.

2342. Air-1 + VIC-20 as CW Reader

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-04 15:59:54 UTC
From: jkeller@pica.army.mil
Message-ID: <9109041159.aa19734@COR2.PICA.ARMY.MIL>
Source record: 294065

G&G Electronics offers a morse de-coder consisting of their "Air-1"
coupled to a VIC-20....supposed to be similar to the old Microlog
unit? Has anyone had any on-the-air, practical experience with this
set-up? Does it really work? It seems to demonstrate fine in the
controlled environment of a hamfest booth, but with QRM/QRN/weak sig/
etc...."real world"....is it worth $150 ?

Any info on this or other mfg. similar units appreciated.

Jerry K1MER

P.S. Much thanks to Herb WL7BIL for his excellent encouragement to Jim
Scheimer on "jumping in" on 10 meters....Derek's (AA5BT) remarks also
Both of you guys represent the kind of hamming that will keep us all
active, interested, and above all QRV in decent freq allocations....
I can't help but think that the huge majority of us support similar
ideals and just plain manners....if the situation ("bringing jamming
technology into the 90's") that seems to excite Roger Bly-KA6MWT ever
become widely accepted, I'll hang up my headphones and forget it ....

2343. Here I am (was Re: the new no-code hams)

In article <54773@ut-emx.uucp>, oo7@ut-emx.uucp (Derek Wills) writes...
>However, the main argument for this license at the time was that it would
>bring in all the technical wizards who are needed to revitalize the hobby,
>but who (for whatever reason) were unable or unwilling to learn to copy
>morse code at the rate of one letter every two and a half seconds.
>
>Why haven't there been any ecstatic postings about these new additions
>to the ranks? I only know of a few no-code licensees, none of them are
>the technical wizards we wanted to attract, but my sampling is probably
>not a fair one.

Well, I got my ticket about 3 months ago (I was waiting for my wife so we'd get consecutive calls, she got N1IUS, I got N1JBJ, grumble grumble), and it allowed me to get my teleoperated vehicle project up to what I call "Phase One Complete", ie. you can drive it around outside while you sit inside and watch the video. The 9600-baud packet gear for the command and telemetry link is next, then we'll have some real fun! [Yes, this is ham radio as a means to an(other) end, in this case (Simulated Lunar) Teleoperations, but that's no problem.]

I talk to my wife on 2M, either using repeaters or simplex (the HTs were very useful for keeping track of each other at the World SF Con in Chicago last weekend), but I've found that talking to other hams that I don't know is pretty boring. I've got a couple of other friends who should get their tickets, but I've learned not to push, they will get there or not on their own schedule. In my limited experience, most hams talk half-duplex to hams they don't know. Not half-duplex as in how radios are, but half duplex as in "Talk at someone about whatever you are interested in, discard their response (it's on a different subject), and talk at them some more." Maybe it's just that we haven't met and don't know what we have in common, but it's not particularly worthwhile. I'm going to a club meeting tonite, so maybe things will be different, but my interests (ATV, especially FM TV, 9600-baud packet, especially full-duplex non-AX.25, and teleoperations using the above) don't seem to match with any other hams, so I'm off doing my own thing. And boy is it useful, and _lots_ of fun!

2344. Re: Zero beating a transceiver

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-04 16:26:51 UTC
From: mikemr@microsoft.com
Message-ID: <1991Sep04.162651.27361@microsoft.com>
Source record: 294066

Having always used separates (antique TX/RX), I always knew
exactly where my signal was in relation to the received signal. When
I got an IC-765, I tried an experiment using my (now) auxiliary
RX. I was at zero-beat with the other CW station when his CW note
pitch was exactly the same as my 765's sidetone pitch, assuming the
765's "CW Pitch" control was at the center of its range. Icom should
have made the sidetone pitch track the "CW Pitch" control, because
when you change the *received* pitch, you can no longer match the
two pitches to obtain zero-beat. They did it correctly in the 781,
but it isn't worth the extra $2k.

2345. Re: Repeater Controllers was (Re: Palomar Telecom RBC-700 info)

>Just a quick note of praise for the S-Comm 5k controller. It has to be
>the most flexible, fully remotely programmable, $200 controller on the
>market. Great support and lightning warranty as well. Thousands of these
>are in use at commercial sites. They're worth a look for anyone putting
>up a repeater.

I like the S-Comm too...after all, who else makes a controller that you can
put on your repeater, or at an airport for pilot-controlled lighting(!)...
but there are a couple of things that I found less than desirable:
1) The 32 digit limit on macro strings. This can get to be limiting for
complex applications.
2) The lack of macro-accessible variables. This makes telemetry difficult.

It's certainly the best buy of low-cost controllers, though.

>were 'newer' than mine) that was full of 'Roger, roger', '10-4 on that
>good buddy' and other 'CB' lingo.

This brings up an interesting point - What's so bad about "10-4"? I use
"Ten Dash Four" myself occasionally, and only the humor impaired miss the
fact that it's a joke. Are all hams humor impaired, or just the ones I've
run into on the air? :+)

>'What are we hams doing as a group to encourage/discourage new
>blood? And how are we perceived by the rest of the world?'

One thing we've got to do is get the word out. Sure _we_ all know there's
a nocode ticket, but it's amazing how many people I ran into last weekend
at the World SF Con in Chicago who knew about ham radio and wanted to be
hams and didn't know there was a nocode! Maybe the ARRL or some other
national group ought to let all the science teachers in the nation know
about it, or take out ads in the SF magazines, or buy billboards along
major highways....

co-driver. Seems kind of silly to me since they are sitting next to
each other but I guess they are happy with the results and the price...>

Johnathan, have you ever *been* in a rally car? The noise levels are
unbelievable, plus you're both wearing crash helmets. Intercoms are
essential.

Thanks for the info but I think that people have misunderstood my
posting. I thought it was silly to use the wireless radio headsets
when they were sitting next to each other. I agree that intercoms are
necessary and the noise level is high. Apparently they found the ear
microphone wireless sets to work fine as an intercom and the price was
less than a good set of intercoms would have been.

In addition to the responses you all saw on the net, I recieved
10 thoughtful, helpful, supportive pieces of e-mail. In contrast to
the flamewars that erupt on other groups (and the minor conflagrations
we sometimes see here ;-)) the positive response was incredibly
gratifying. So, to all those new hams that haven't posted for
fear of awakening some old curmudgeon, or who haven't gotten on the
air because they're not sure of themselves, I say GO FOR IT! You
are likely to find a whole flock of people willing to help you out.
And I also say a hearty thank you to all of you who responded.

Jim Scheimer, KD4DEZ
P.S. I've been back on 10m and had a great time, and on 15 and 40 CW.

2350. GPS position logger

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-04 18:19:14 UTC
From: tks@kestrel.nwc.navy.MIL
Message-ID: <9109041819.AA06326@kestrel.nwc.navy.mil>
Source record: 294069

Hi all!

A friend suggested I post this question and see what happens. I don't check the net, so pleas respond directly to me (tks@kestrel.nwc.navy.mil).

I'd like to build/obtain a 'black box' position recorder based on GPS. It needs to be small, simple, battery operated, and should last at least 24 hours per charge/battery replacement. An RS-232 serial connection might be the only I/O interface.

Why do I want this?
I fly sailplanes (gliders). A typical flight in the southwest can take me 300-600 miles on a straight, out & return, or triangular course. If I'm trying to set a speed or distance record, or competing in a race, the current method of proving mt accomplishment is rather crude.
I carry a barograph (pressure recorder) that is sealed by an observer, and a camera (35mm instamatic) that shoots down my left wing from the cockpit. The observer loads the camera with a fresh roll of film & we take a photo of a flight declaration to initialize the film. At the end of the flight, the observer notes altitudes & times from the barograph to prove I was airborne all the time, and has the film developed to prove I have reached my declared turnpoints.
If I fly for speed, I must pass through an imaginary 'window' that is 1000 meters square above my start point. The altitude is determined by making a 'hack' on the barograph before departure, then noting the elapsed time to my start. After the flight we measure the altitude from the paper (or recently, electronic) altitude record on the barograph.
During contests, we have spotters with triangulation viewers to determine the start altitude.

I would like to propose an alternative to the above...
A GPS receiver with a microprocesor controlled recorder that logs time, position and altitude onto a nonvolatile circular buffer. A compression scheme could be employed to possibly record endpoints of a 'smoothed' trajectory instead of all the intermediate positions.
The box would only have a power switch and RS-232 interface.
A simple command set could be developed to query the box for current position, last n minutes/hours of data, etc...
Optional displays, glide computers, etc., would talk to the box via this port.

I'm not into ham or hardware (I do software), but I have friends who can help me with that.
If anyone has information on cost, current projects that could be adapted, manufacturers, or people who are doing something similar, please let me know.

I foresee a worldwide soaring market of several thousand units. I think this could also find application in many cross-country racing events such as auto rally, boat, airplane, etc...

Thank you,
Tom Serkowski

A sleek, lightweight, and easy-to-use unit like you
described has been available commercially for several years.
It goes under the name "Magellan." If you want, I can send you
a flyer (no pun) on it. They cost about $2,500 or so.

MRO

Hello all!

We've been lazy around here about getting some flyers to the local
Radio Shacks concerning their new HT. I know I saw a sample letter
to Radio Shack concerning requirements to purchase a HT in a previous
digest, but deleted the message. Does anyone out there have the text?
I have a Mac here so I could take a fancy version (MS Word) if you've
got one of those hangin' around...

Whether its true or not it is a very hot discussion topic from time to time
among the vhf-microwave crowds. (:>)

Actually I think there have been a number of studies which verify it.
The mechanism I've seen quoted most often is related to the Brewster
angle. Given non-perfectly conducting grounds there is an angle for which
transmission is zero for vertically polarized signals. I don't think
it relates to direct versus ground ways since that applies to both
polarizations.

Someone else can go look up the details but it seems to me it is
related to the component of the reflection from the discontinuity at the
air/earth interface being equal in magnitude and exactly out of phase
with the (delayed) component travelling through the earth. Horizontally
polarized signals don't experience this. This effect can be used to
make polarizers and it seems I even remember some optical instance of
this that people utilized in experiments in physics classes but I can't
remember the details. No doubt someone on the net can set us all
straight on this.

I have heard claims that this effect is measurable through at least
the low microwave region.

I bet this is why polarized sunglasses reduce reflections from
reflecting surfaces (so you can see the girl in the bikini under water
in the swimming pool.) The sunglasses are vertically polarized, and
the reflection from the water is mostly horizontal.

>it can be done.

I've seen Heathkit HW-16 transceivers with matching HG-10 VFO going for
$50 - $100. This is a very usable CW-only radio with coverage on the
80, 40, and 15 meter bands. It has a pretty good CW-bandwidth filter
and around 50 watts output. Also many of the old "AM" transmitters,
while pretty useless on phone (no flames, you AM'ers!), still make fine
CW rigs. You can often get an "AM" transmitter for free, or close to
it, and the matching receiver generally goes for $50-$100. Examples
are the Heath Mohawk receiver / Apache transmitter, Hallicrafters
32V2 transmitter / SX??? receiver (many models), Drake 2A or 2B
receiver and 2NT transmitter (you'll also need a vfo for this one.)
Also Hammarlund and other companies. Check out a ham flea market or
some ham buddies' basements.

Code keys are $10-$20 depending on quality (plastic base works fine.)
Dipole antennas are practically free, plus the cost of the coax feedline.

I'd say $100 - $150 is a more realistic minimum unless you build
your own equipment out of junk parts.

What I've been curious about is whether the Baltic ham organizations needed any permission from the central Soviet government to switch back to these prefixes from the Ux ones they'd be using. Seems like they all started using them about the same time (last fall). Anyone know how that came about?

I recall the opposite, Al; namely that signals arriving after one or more reflections off the ionosphere tended to be principally vertically polarized rather than horizontally polarized.

Where *that* memory originates is lost in time. Seems to me it seeped in sometime in the mid-60's when I did a lot of 6-meter am/cw work (what a fool I was! Everyone with an Andrea TV within a 15-mile radius knew my name and qth...)

> many letters supporting HR 1674 from amateurs as another
> section of HR 1674 forbids the FCC from charging license
> fees to amateurs and the ARRL has urged support of it.

This would apparently explain why the ARRL hasn't answered my MCI Mail message expressing concern over the 8b) language. It sounds like the ARRL supports this bill unconditionally, and if this is true (and I'm not yet assuming it is), it strikes me as being somewhat shortsighted.

Having said that, I realize that the ARRL is a ham radio organization, not a scanner organization. But ham radio and scanning aren't totally seperate persuits. Although I'm not a licensed operator myself, I would venture to speculate that the majority of operators have at least one such receiver in their shack. And I can't see how they could be helped by the scanner provision of H.R. 1674. In fact, they may even be hurt by it. Particularly if we begin to go down the slippery slope of additional restrictions which would ultimately result in a total ban on scanners (or more likely, a substantial block of frequencies which will eventually be prohibited).

But in any event, I agree with your position: Let's not throw out H.R. 1674, *but* we should still do everything possible to get rid of Section 8!

2365. Getting Started

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-05 04:06:22 UTC
From: UD180274@NDSUVM1.BITNET
Message-ID: <91247.230622UD180274@NDSUVM1.BITNET>
Source record: 293930

Hello!
I have just (several weeks ago) passed my part 1, 2A, and 3A
exams to earn my Technician Plus HF license. Once I recieve my license
in the mail, I'll be operating primarily using a crystal 2m rig in the
car.

I'd like to do some cw work on some of the other bands, but I'm limited
by living in an apartment with no capacity to put up an exterior antenna.
Can anyone make any suggestions on what I might try as an alternative?

Also, if anyone has any "words of wisdom" for someone just starting out,
I'd be delighted to listen! Thank you!

Roger

Source record: 293967

endelman@eng.sun.com (Aaron Endelman) asks;

<...I'm hacking N2CN's morse code program to allow for a user-supplied speed,
and I need to get the numbers right....>

Hasn't this already been done? If N2CN's program is the one that was posted
here recently that switches the console bell on and off, it definitely has.
Someone posted a diff that gave variable speed with a "-s" switch, and I have
subsequently modified it (and posted a diff) to do "long inter-character gaps"
(sort-off pseudo Farnsworth :o) (actually, just leave 4 times as much space
between characters as yiu would otherwise get.).

Mail me, and I'll send you the whole thing.

To answer your original question, the "industry standard word" is "PARIS". You
can work out the dit and dah length by simple arithmetic, knowing that if a dit
is 'n' long, a dah is 3n, the interelement space is n, the interletter space is
2n and the interword space is 6n.

For Farnsworth spacing, send the characters at 15wpm and adjust the
intercharacter space to give an overall speed of whatever you like...

73,

Hugh, G0CNR.

2368. 222 MHz: vertical vs Horizontal

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-05 13:34:00 UTC
From: MROWEN%STLAWU.BITNET@cunyvm.cuny.edu
Message-ID: <9109051333.AA13036@ucsd.edu>
Source record: 293948

KE4ZV : "Yes, "ground gain" is greater for horizontally polarized signals than for vertically polarized signals. Why? ... The cross polarization for vertical signals can cost up to 30 db. Since ground gain can add at most 3 db to your signal, a 30 db drop in the adding signal will just about negate any advantage to be gained from the ground reflection."

W9IP : I guess I don't understand whether ground gain is the same as normal addition of direct and reflected rays. My original question had to do with whether the ground reflected ray is less well-reflected if it is vertically polarized. Are we talking about the same thing? I always thought that the situation looked like this:

```
///// direct ray->--.- direct + ground reflection---->------------
:. .
: . .
: . <--- ground reflection
```

(neat graphics, eh?)

Only if the antenna is aimed way up in the sky does the ground reflected ray not help out. And based on Gary's statement above, does that mean that a satellite antenna looking up has 3 db less gain than when it's looking at the horizon? I doubt it.|

Is what I've described the same as the "ground gain" used by on-the-horizon moonbouncers?

KE4ZV : "... more multipath."

W9IP : I don't think that this has any bearing on tropospherically-propagated signal paths longer than a hundred km (which is what weak-signal SSB/CW types are interested in). For "local" FM in cities, maybe it's important.

KE4ZV : " ... extra noise pickup with verticals."

W9IP : I don't buy this. Sure, it's part of amateur folklore, but I sure haven't seen it. At HF and low-VHF, maybe verticals have a noise pickup disadvantage, but not at 222 MHz. As I mentioned in the QST piece, there is precious little artificial noise at 220 MHz except in the middles of big cities (and who would want to try weak-signal SSB/CW there?). Noise at 222 MHz is predominantly 270-350 K "Earth noise," which has no preferred polarization. Of the rare artificial noise sources (sparks, neon signs, light dimmers, etc), I just can't see how/why they would be preferentially vertical. Also, as pointed out to me by Kermit, K9XA, a long yagi oriented vertically (ie turned

so it's vertically polarized) will have its typically larger set of sidelobes "seeing" the horizon and the sky and correspondingly less "seeing" the hot Earth in the foreground. This ought to result in *slightly* cooler antenna temperatures than the same antenna oriented horizontally.

None of the above should be mistaken for a flame. I have a lot of respect for Gary, KE4ZV.

2369. computers - SSTV,WEFAX,FAX

Yes, I saw this happen! It was quite a sight (and sound). Not, thankfully
on one of our vans but another station's.

An English firm 'Clark' make a very good range of pneumatic masts but
I'm not sure if they are available in the US.

These masts are also VERY expensive when compared to a Rohn 25 type tower!

2800 Meadowview Rd., Sacramento, CA 95832 (916)427-4281
RACESBUL.185 DATE: September 2, 1991
SUBJECT: PRESS - PUBLIC RELATIONS, Part 4/5
In any ICS event there can be only ONE VOICE. Don't ever forget that I said....ONE VOICE. A one-voice story comes from the Public Information Officer ONLY. That's the one voice I am talking about.
If you are doing your job as a communication specialist, the chances are that at some point the press will poke its nose into your "bailiwick" and will want to know what is going on.
It is the absolute right of the press under the First Amendment to the United States Constitution to know and report what is going on in the public domain. That is Freedom of the Press.
In any situation in which we are working under the ICS system...and that will usually be the case in disasters or severe emergencies from here on out, what we say MUST be cleared with the Public Information Officer who speaks for the entire incident.
The reason.....simply....is consistency. We can't have, for instance, one fireman saying that the fire is "under control" and another fireman saying, "all hell is going to bust loose any minute." We can't have a cop saying "the situation is under control" when another cop says "the gunman is still armed, has five more rounds of ammo and two grenades." Or, one weatherman saying "the eye of the storm has passed" and another saying, "You have not seen the worst of it yet!"
The single voice system is the ICS way of controlling rumors. We don't want to be part of any rumor mill. What we must do with the press if they show up is to assign one member of the ham radio community to interface with the Incident Public Information Officer and the Press. It may sound cumbersome, and it can be, but it can also protect our credibility with the community, and with the press, and the Incident Commander. The IC will appreciate our attention to this matter.
How do we go about this delicate task of telling our side,

and continuing to feed that oat and honey mixture to the press?
First of all, agree at your location how the press will be
handled -- and by whom. Know who the public information officer
is and how to get hold of him pronto.
(to be continued)
EOM

>that the voltage never rises above 13.8 volts !

Many voltage regulators have current limiting capability as well. You can take advantage of this by setting the current limit to the 10% figure. One other current limiting method is to use a smaller transformer that couldn't provide more than the 10% figure. The transformer becomes warm, so provide adequate ventilation or forced-air cooling.

A friend and I developed a low-dropout current-limited regulator that drops into any commercial battery charger. It consists of a power op-amp and a D45H5 transistor on a 1 square-inch footprint. If there's interest, I could post the circuit to the net.

Does anyone know where a version of Mininec later than or equal to 3
is archived? I am particularly interested in a version with mnpre.
Please reply directly to N62@psuvm. Thanks! Dave.

2377. Indoor/restricted-space antennas.

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-05 15:59:32 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <05.Sep.91.17
Source record: 293968

Antennas for restricted locations - well i can recommend tuned magnetic loops; they are convenient (can go in attic space or even stand in the corner of the room) and relatively efficient. They also have narrow bandwidth. This may be seen as a disadvantage (you gotta tune the antenna every time you QSY) but the advantages of this high-Q behaviour are:-

1) Adds valuable front-end RX selectivity; This is particularly important if your RX is not too hot at dealing with the local megawatt-and-Rhombic broadcasters on adjacent frequencies...

2) Cuts down on receiver images (helps when using a cheap superhet RX with 455KHz IF on the HF bands).

3) Not too good at radiating TX harmonics. If you are running a homebrew single-tube or solid-state TX, then you just *may* be generating some significant harmonic energy which can cause TVI etc. The loop will provide extra attenuation of these, and reduce the likelihood of that infamous 'knock-on-the-door' in the middle of you working some exotic DX.

There have been various designs of HF magnetic loop - they *do* require thick copper tubing for the loop and a good-quality HV variable capacitor to tune the thing to resonance, also some sort of motorised drive for the tuning if you mount the beastie remotely. A real cheap slow-motion drive for this can be constructed using the motor & gearset from a battery-powered bar-b-q rotisserie and additional plastic gears from an aeromodels shop...

If you do not want to build it yourself, you can always fork out $$$$ on an AEA Isoloop, but half the fun is in the building.....

For the upper HF bands, i recommend the 'DDRR Hula-hoop'. Its a relatively high-Q design but is compact and can fit in an attic. Check mid-sixties copies of ARRL handbooks for construction details. I have seen one for 10 meters built using the flat roof of an apartment block covered with thin zinc-dipped steel sheet as a groundplane; the main loop of 2-inch alloy irrigation pipe was not visible from ground level and so neatly bypassed the local restrictive 'no antenna masts' covenant.
This antenna and a 100-watt CW TX (two TV sweep-tubes in parallel driven from a modified CB rig) has netted its owner as many QSOs as he feels capable of handling. Total cost? TX plus amplifier plus antenna less than 50 UK Pounds!

Why not build a decently designed Nicad charger using your Yaesu box
as power supply and enclosure? A good circuit is the AA6PZ design in the
ARRL handbook and rumour has it that AA6PZ still has bare circuit boards
available for ten bucks. (Address in the call book).
I have no connection with AA6PZ except that he's my buddy Paul who works
here down the corridor!

2384. Re: Antenna Advice

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-05 18:17:50 UTC
From: paulz@hpspdla.spd.HP.COM
Message-ID: <32920021@hpspdla.spd.HP.COM>
Source record: 293946

So-called invisible antennas are primarily an issue in the HF bands
where the antennas are ten's of feet long, depending
on exactly which frequency you are interested in.

On 2 meters, a quarter wave whip is about 19 inches, so fitting an
antenna inside is not a big challenge. If you are not too far from a
repeater, just use the rubber duck (aka dummy load) that comes with the
HT. You can even move from room to room.

For better results use one of the telescoping whips.

For an antenna in a fixed antenna you might consider a j-pole which can
be cut from a 4 foot piece of TV twin lead. The details seem to be
posted here from time to time. A half-wave dipole oriented vertically
is also a good choice.

Congrat's on passing your exam and welcome to Amateur Radio

Paul AA6PZ

2385. I need a sidetone oscillator

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-05 18:24:31 UTC
From: heacock@kuhub.cc.ukans.edu
Message-ID: <1991Sep5.132432.33289@kuhub.cc.ukans.edu>
Source record: 293939

OK, here's one for the hardware-diddlers among us:

My HF rig (a Drake TR-3) doesn't have a sidetone oscillator, and I'd like to have one. I have messed around a bit with some circuit ideas, but I haven't been able to put something together that works well yet. I have played around with a couple of circuits that might eventually turn on an oscillator in the presence of a strong RF carrier, if I ever get them to work right.

Another thought was to use my straight key to turn on two transistors, one of which would key the rig and the other of which would switch on an oscillator. Sound feasible? Any better ideas? Detailed circuit suggestions?

Tnx in advance.

Source record: 293965

re: the sailplane pilot looking for a position logger:

The new Rockwell "NavCore V" GPS receiver would probably
do the trick for him. Small, RS-232 position with no fuss or muss. A small
uP and some EEPROM could easily do the logging function. Presently the
RCS card is sold only to OEM's, with some of the OEM's producing "personal
locators" from it. Within the next year or so, he'll have several such
devices from which to choose from. Prices should drop under $1K soon.
Eventual prices will probably be a few hundred dollars, at most.

The people in Dallas have been working all the angles and already have
HUGE orders. The best solution for the guy is to keep an eye out, what
he wants will be availible "Real Soon Now" for any one of several sources.

Hi

I am an international student doing my Master's degree in Electrical
Engineering.
I am very much interested in becoming a ham.
I would appreciate if anybody could let me know how to go about it-
which books to study for theory and regulations for hams in USA,
what exams to appear for and when & where the exams are held etc. etc.
(I would be starting from scratch.)

Also, in India (where I come from), one is exempted from the theory exam
if he / she has a Bachelor's degree in Electronics / Telecommunication Eng.
He / she has to appear only for two exams viz. Morse code and regulations.

I would highly if someone would provide me the required information and
help me to get started.

>of the sort.

Thats all very well if you can get one of those things! The Rockwell people told me that they would only be available toward the end of the year and that the $500 was a quantity OEM price.

Quote: "Delivery is set for October-November 1991 time-frame. Currently, our minimum order is 100 boards at a price of $500 per board."
- from a letter dated 6/13/91

($50,000 is way out of my budget)

The Motorola unit, which is very similar, is also exepected out 4th Q 91.

Stanford Telecom and Magnavox have advertised GPS Engines. The magnivox unit is bigger (2.55" x 6.33") than both the Motorola and Rockwell units.

The fully packaged up Trimble units (abt the size of a 'Pocket Oxford') are available now. (These are the same as were used in Saudi Arabia during the recent unpleasentness).

Does anyone have more recent info?

>hand. I can not substantiate this assertion with fact. If anyone out
>there knows about this I would greatly appreciate a posting to info-hams.

When I was 15 I bought a 19 set as my first station and kept it by my bed for
a few years. Later I found out that all that nice luminous lettering (all the
lettering on the front was luminous) was done with radium paint. Twenty years
later I and my family are living experiments in radium exposure. The old
boat anchor is still sleeping in my parents basement some place.

IMHO the radium paint on my 19 set was more of a risk then the dials on the
R390 since it was exposed to the world to be licked, scraped, sanded etc.
Once I was going to sand the cabinet and repaint it but I didn't because I
liked the luminous lettering - I am real glad I didn't do that trick.

The luminous lettering on many wartime relics were hand painted by young ladies
who suffered great harm chiefly because they would point up the paint brush
with their mouth. Not nice.

Telephone interference is a serious problem that I think will get worse as the inexpensive phones continue to come into use. I've got a GE "21 memory" phone and it picks up my HF. I have worked with that and no solution so far. Unfortunately my neighbors have a 32 memory phone with built in speaker and I'm into that one quite badly. I have read several articles on phone interference, have tried the torroids, used bypass caps, and no luck. I've purchased the Palomar RFI experimenters kit, and tried both Palomar and Amidon cores of the correct materials for HF band.

With the "good old heavy phones" a small cap across the receiver seems to take care of any slight noise. But with these "new solid-state" phones (not to imply that the old ones used tubes :-) I haven't found a fix. With the one across the street I could disconnect it from the wall and power with a 6 V battery and run a cord across the room for an antenna (but not connected to the phone wiring in the wall) and I can be heard on the phone. I tried torroids with 100 turns in series with both tip and ring lines and this didn't solve the problem.

KB2GLO, I wish you luck, if you or anyone else finds a solution that works with these #@(*&^%@ modern phones please let me know.

+ 800-922-9083 (Consumer Products)
+ 800-821-7848 (Land Mobile Radio)
+Consumer products group has the 49MHz stuff. Interesting enough,
+they do not have any commercial gear with the ear-mic -- only the
+consumer stuff like 49MHz and one CB radio. (I wonder if this implies
+how well the ear-mics work.)

If it's the ones I've used, yes. We bought some 49-EA Maxons a
couple of years ago, to use for comm in paintball games. We
found that the Maxons lasted for maybe a couple of games before
reception disappeared. The ear mikes provided decent sound,
but the wire to the earmike was too stiff and kept pulling it
out of the ear, or unplugging from the mike portion. In a
neighborhood full of trees and 1 story homes, you could get maybe
one block non LOS transmission, if you were lucky. Out in the
forest you get maybe 30 yards worth of range. These things also
seemed sensitive to sweat running into the earpiece.

Somewhere at home I think I have info on high quality earmikes.
Designed for use by SWAT teams, they run several hundred dollars
as I recall. You buy the mike and belt mounted switch, then pay
extra for a mike<->radio interface which is made forwhatever radio
you're using. This company had a VOX, PTT, and ring switch. The
latter used a ring which you wore: when it touched metal the mike
was activated. This was intended for cops who had guns in their
hands. I'm still trying to find the info: if I find it I'll post
it.

Is that the same glow-in-the-dark stuff as on old wrist watches and clocks, inside light switch handles, etc? The stuff that needs to be exposed to light to "charge" after which it glows for an hour or so, and gives off a greenish light? If that stuff is a well documented health risk, I have never heard of it. Or are we talking about different stuff here.

Source record: 293936

Below I am attaching a letter which I transmitted this evening to the American Radio Relay League on the matter of H.R. Bill 1674.

If you have any reaction at all about what you see here (ok, even if it's a FLAME!), I would strongly encourage you to post a follow-up article. If this letter sparks any kind of discussion within the amateur radio community, then I feel it has served its purpose. It was with this in mind that I posted this to the Internet.

If anyone wants me to repost that portion of H.R. 1674 that I'm worried about, please E-Mail me at sjr@mcimail.com and I'll gladly repost it. Thanks in advance for your consideration of this item. S.J.R.
Date: Thu Sep 05, 1991 11:14 pm GMT
From: Sander J. Rabinowitz / MCI ID: 382-9147

TO: American Radio Relay League / MCI ID: 215-5052
Subject: H.R. 1674 and Scanners
Message-Id: 23910905231432/0003829147NA2EM

Recently, I sent you en electronic E-Mail (via MCI Mail) expressing my concerns about H.R. bill 1674. I was at that time unaware of your position on this legislation, and to be honest, I'm not certain as to your position now. But I want to take this opportunity to clarify my position.

Please understand that I am not against *all* of H.R. 1674. I remain, however, concerned about that portion of the bill dealing with scanner radios. And it isn't because I wish to listen to cellular calls, either. My concern, rather, is that it is vaguely worded, such that conceivably *all* future scanners could be banned under this legislation.

I would submit to you that a scanner isn't just something that is used by a scanner enthusiast--indeed, I would venture to speculate that a large number of ham radio operators also use scanner radios. There's significant overlap, I think, between using a scanning radio, listening to international shortwave radio, and being a ham radio enthusiast. Many people who have entered ham radio may have started in the first two categories. Therefore, anything which adversely affects scanning or shortwave radio is going to have a negative impact--both directly and indirectly--on amateur radio. With this in mind, I believe H.R. 1674, **with the present scanner radio language** may hurt amateur radio.

If your viewpoints coincide with mine on the matter of H.R. 1674, please view this note as one of appreciation for what you are doing. If you do, however, support the legislation as it's presently written, I would kindly reinterate that I'm not against ALL of H.R. 1674 and that you please reconsider that portion of the legislation which deal with scanner

radios. That's all I ask.

Best wishes.

Sincerely,

Sander J. Rabinowitz

+Gene, WA1UXA posts:
+
+These are the long awaited "R-1" transcievers that ICOM has been subtly
+referring to for the last 8 months. ICOM got into a patent dispute with a
+scanner mfg over the R-1 (hand-held super wide-band scanner) and was
+unable to import them into the US market. They have figured a way to
+circumvent the dispute by building in a transceive capability. So, what
+I'm trying to say is that these units should have the same receive
+features of the R-1 along with the transmit capabilities in the amateur
+band featured.
+
+The problem with these radios will be a (probably) severe receive intermod
+susceptibility due to virtually no front end selectivity. (This to allow
+the super wide-band receive coverage) I know a couple of guys who have
+the R-1 and they are VERY disappointed by the intermod heard by their
+units.

Actually, the coverage of the R1 is .1 Khz to 1.3 Ghz in AM, FM and WFM.
The new rig is much closer to an improved IC-24AT than an R1.
Regarding R1 selectivity problems, I have never heard of an R1 suffering
from intermod. However, there is a design compromise in the bandpass filter.
In-order to accomdate commercial WFM broadcasts, Icom used a 200 Khz wide
bandpass filter. This has the unfortunate effect of allowing anything within
200 Khz of the signal you are receiving in narrow FM to bleed and capture
the receiver if the primary signal is weak or off. A company in the UK called
'Racom' currently offers a replacement bandpass filter which pass's only the
first sideband component of the WFM signal... thus, at a cost of fidelity
(Who cares in this type of receiver?) The problem is eliminated. Racom
requires that the R1 be sent to them for modification. EEB in Virginia is
also now carrying the R1 and are purported to be experimenting with their
own filter design.

When they changed the voice, they introduced some low frequency noise which wiped out many of the Heathkit GC-1000 Most Accurate Clocks (including mine). I called Heath and pointed out that, since I live in Fort Collins, and my clock had worked for 6 years, that WWV screwed something up. Heath then called NIST and they quickly converged on the problem and inserted a filter.

The old voice belonged to Mr. Donald Elliot Heald of Atlanta, Georgia. I bet I'm only one of 5 people in the universe who knows this. I don't know if the gentleman is still alive; I found this out in the late sixties when I briefly considered trying to propel him to national fame.

I agree that the digital voice sounds too smug when it says "time".

>Off hand I don't have the address but, from what I remember it was Waterloo
>House in London. Of course I was there 10 years ago, so things have
>probably changed but someone at DTI (radiocommunications div) would know.

In 6/88 they were still there:

Dept of Trade and Industry
Waterloo Bridge House,
Waterloo Road, London SE1 8UA

These were the folks to whom I sent proof of being licensed in the Dark Ages, they then sent the paperwork on to the RALU who issued the renewal.

But the best bet is still to write to the RSGB or call them, as others have suggested. If they are on the ball, they will send you much stuff to get you interested and licensed.

Does anyone know whether you can get e.g. a VK licence on the basis of already having a G one? - perhaps with a test on the VK regs etc. The VKs are enlightened enough not to require the technical exam of anyone who has a technical degree (EE etc.).

Well I still have a 19-set in the shack... i always wondered why i had
never needed to switch the room lighting on.... :-) Maybe i should call
the IAEA and get them to encase it in lead & bury it somewhere.....
There was a scare sometime in the Fifties about pilots sitting in front
of aircraft instrument-panels painted with the radium paint, and the level
of radiation dose they would receive; i believe that someone studied it
and found the dose from the instruments was about equal to the dose
received from the increased incidence of cosmic rays at elevated altitudes.

I had a lot of trouble with a couple local broadcast stations, a TV station (buzzzzzzzzzz) and my 100 watt HF rig getting into my phones and modem.

Luckily it was curable without any surgery other than removing the case of one of the phones. I bought some generic cores at "IC Supply" and wrapped 5-10 turns of the phone cord through them, right where they enter the phone. Every line coming out of the modem was treated similarly, including the power line. Same with the answering machine. This cured one phone completely, and the other was improved. Next I opened up the desktop phone and placed smaller toriods on the incoming lines, both for the handset and the line cord. This helped some more. Finally I determined that the interference was affected by the orientation of the handset cord, indicating that it was a major point of ingress. So, I stuck small toroids every 6 inches or so on the handset line.

This completely cured the trouble. I was forced to use toroids since there is no RF ground at the 70 foot level! A cleaner way to obtain inductance on the han handset would be to install an RF choke in series with it, internally. Any inductors you place in the line cord need to pass about 100 mA for the ringer.

Keep on trying, it's curable! (usually...)

>of the circuit, even if the transmitting antenna is vertical.
>
Though I don't have the article here, this past winter there was an article
in one of the issues of Communications quarterly (I mean there have only
been four issues... I think it was the second issue) where an amateur studied
the polarization shifts of various (obviously fixed polarization & location)
beacons. He then went on to conclude that the F-layer ionospheric refraction
was creating these varying shifts... which he could not (or just did not)
attemps to coorelate with any identifyable factors. The article did go on to
state that they beleived that the transmitting polarization was not the critical
factor that needed to be matched but the received signals polarization needed
to match (because the xmit signal.. whether vertical or horizontal at onset,
would both shift after refraction to some polarization angle - possibly
horizontal or vertical... but most times not.
Oh yeah the point... 220 doesnot usually experience ionospheric refraction..
(the article didnot say anything about e-skip/aurora/TE etc. etc.)

Once again, I do think many of the points Mike has brought up are valid
but if for nothing rather than convention and 30dB extra isolation from
channel 13, machine noise (I know. it is a quieter band), and FMers..
especially in the light of some of the obnoxious bandplans (albiet proposed
not yet "implemented") that have been swirling around. Oh yeah, and I already
have the two yagi's..... which I could stack.... hmmmmm...

Maybe... oh wait... tower mounting... yeah what about tower mounting.

Oh I don't know... but if you can dig up the HF CommQuarterly article,
it's pretty good and it gets one thinking about the possibility of polarization
variable recieving systems. (For HF that is)

Both W9IP and KE4ZV have made some excellent points in the great
horizontal vs vertical polarization debate. I submit that many of our
"wives tales" about the subject have their foundation in unscientific
observations of low-band antenna systems with inadequate ground systems,
lossy radiators and primitive test equipment. With MN, YO and ELNEC, we
have moved away from beleving what we modeled at 220Mhz will have
direct correlation to what happens at 7Mhz. Conversly, placing a
160 meter beverage receiving antenna close to a vertical radiator is
a sure way to couple vertically polarized noise into the receiving
antenna, but this has little bearing to having your Ringo Ranger above
a 2 meter yagi.
I'm moving to a hill-top over exellent ground. I'm looking forward to
doing some real experimenting with the psudeo-Brewster effect. Stay tuned.

There is a legend, myth, or just plain ole folk tale in these parts that some of these "young ladies" would paint the stuff on their teeth to surprise their boyfriends at the drive-in (remember those). The radium plant was located in Dover (or Wharton), NJ and has since closed its doors. I rather doubt that any of those ladies are still around to tell tales of those days. Gives new meaning to (literally) "glow-in-the-dark." 73, Walt - K2WK.

>Actually, the coverage of the R1 is .1 Khz to 1.3 Ghz in AM, FM and WFM.
>The new rig is much closer to an improved IC-24AT than an R1.
>Regarding R1 selectivity problems, I have never heard of an R1 suffering
>from intermod. However, there is a design compromise in the bandpass filter.
>In-order to accomdate commercial WFM broadcasts, Icom used a 200 Khz wide
>bandpass filter. This has the unfortunate effect of allowing anything within
>200 Khz of the signal you are receiving in narrow FM to bleed and capture
>the receiver if the primary signal is weak or off. A company in the UK called
>'Racom' currently offers a replacement bandpass filter which pass's only the
>first sideband component of the WFM signal... thus, at a cost of fidelity
>(Who cares in this type of receiver?) The problem is eliminated. Racom
>requires that the R1 be sent to them for modification. EEB in Virginia is
>also now carrying the R1 and are purported to be experimenting with their
>own filter design.

Actually, it's RAYCOM (after Ray Withers, the owner). My R1 has been at
RAYCOM since mid-July waiting for the filter upgrade. Every time I call
Ray tells me they are inundated with filter upgrades, and they have one
technician who must do repairs, upgrades on other models, and ... oh, yes
... R1 filter upgrades. I was promised mine would finally be done last
week. We'll see.

The RAYCOM mod switches in an ADDITIONAL "roofing filter" in N-FM and AM
modes. This completely eliminates the 150 kHz adjacent channel bleed-through
as well as removing background static from AM mode. Francois Michaud of
CBC sent me a reprint from a British magazine where the RAYCOM mod was
reviewed late last year, and they RAVED about it.

I hope to post my own review of the R1 upgrade if, and when, my radio
returns from England.

2413. Kenwood TS820S digital display problem

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-06 13:16:00 UTC
From: JMG%TNTECH.BITNET@cunyvm.cuny.edu
Message-ID: <01GA96MC7TTCDLGV9J@TNTECH.BITNET>
Source record: 293976

Help!!!

Would anyone have a suggestion to remedy the following
problem on a Kenwood ts820s:

The digital readout sometimes only comes on with a
single digit, or it will be working fine then the
digital display lights will become less bright and
then fade to one digit. After a while the display
will come back and work fine.

Thanks in advance for any help.

Jeff M. Gold AC4HF

2414. Telephone RF interception.

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-06 13:24:18 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <06.Sep.91.14
Source record: 293977

Dont know about the US, but here in the UK, my understanding is that
a telephone is legislatively not seen as a RF instrument, and any pickup
of RF that causes trouble is, in law, not the responsibility of the
source of RF to fix it. Same with audio systems (as long as they do not
include a radio receiver, they have no business receiving RF!).
When my neighbors picked my transmissions up on their domestic intercom, i
pointed out very definitely that it was not *legally* my responsibility to
fix, and that i was not prepared to fix it. Fact was, I identified the
problem and told them what to buy to fix it (some ferrite clamp-on chokes for
the connecting wire) and offered to fit the parts once they had bought them,
to be a good neighbor, but i expected them to pay for the cost of the chokes.
If a device is demodulating RF, and that device is not specifically designed as
a radio receiver, then *by definition* it is at fault. Look at it like having a
hole in your roof. When it rains, you get wet; the fault is not in the rain
itself, the builder of the roof should have forseen the likelihood of rain,
so when you get wet you fix the roof, not try and stop the rain!
I believe this argument was used in a Canadian court some time back, in
defending a ham's right to transmit despite interfering with other peoples
audio systems. He won his case.

"PARIS " was chosen as the standard length word for speed measurement.

with an inter-word space, it lasts for a period of 60 dots

Doesn't this just make the arithmetic easy? I've always wondered whether the choice of standard word was a fix.

>does that mean that a satellite antenna looking up has 3 db less gain
>than when it's looking at the horizon? I doubt it.|

It's true. Of course the colder sky temperature often makes up for the
3 db difference in gain.

>Is what I've described the same as the "ground gain" used by on-the-
>horizon moonbouncers?

Yes it is. However your graphic doesn't portray the situation clearly.
The reflection that adds is a thinly glancing ray. It's angle matches
the first fresnel zone. Or in other words, the path difference between
the direct and reflected rays to the intended receiver must be one wavelength.
If the angle is steeper than the critical angle, or if the path difference is
a multiple of a wavelength, all you get are some nasty upward pointing lobes.
This means that for mountaintoppers the gain is only available at the
radio horizon and basically only illuminates outer space. For stations
operating in flatter terrain, the benefit is available much closer in.

If you picture the ground as a horizontal conductive sheet, you will
see that the E field of a vertically polarized wave is perpendicular

to the sheet. This is similar to placing a horizontally polarized element on a vertically polarized beam. There is very little interaction. With a horizontally polarized ray, the E field is parallel to the conductive sheet ground and interaction is total. At HF where near field effects dominate, this simple picture is much more complex and some gain and "lobe bending" does occur for vertical antennas.

>KE4ZV : "... more multipath."

>so it's vertically polarized) will have its typically larger set of
>sidelobes "seeing" the horizon and the sky and correspondingly less
>"seeing" the hot Earth in the foreground. This ought to result in
>*slightly* cooler antenna temperatures than the same antenna oriented
>horizontally.

Manmade noise is preferentially vertically polarized. I believe this is because most re-radiators are vertically polarized and most manmade noise is going to reach you by a reflected path.

Unless the main lobe is incredibly narrow, it is going to paint the earth with about half it's energy unless you are aiming up to work a satellite. So you're going to see a 290K noise temperature on any terrestrial path whether you use horizontal or vertical polarization. (Actually, it is possible to get the noise temperature down to about 145K with careful design and placement on a fixed path. For typical ham contacts we must assume that such placement has not been done and so we assume a 290K noise temperature.)

Taking advantage of the ground gain available to horizontal antennas is going to make a difference because the noise temperatures are going to be basically the same between the two types. Sidelobes should be a minor contributor to the noise floor of the system since the major contributor is going to be the half power beamwidth of the main lobe.

>None of the above should be mistaken for a flame. I have a lot of respect
>for Gary, KE4ZV.

Hint: Use germanium diodes. Wrap several turns of hookup wire around the coax and connect it to the diodes like this;

```
wire------->|----npn transistor-----audio oscillator
|
-
^
|
Gnd
```

This drawing is awful, but I hope you get the idea. 1N34s are good diodes for this circuit.

>Another thought was to use my straight key to turn on two transistors,
>one of which would key the rig and the other of which would switch on
>an oscillator. Sound feasible? Any better ideas? Detailed circuit
>suggestions?

This will work fine, though with a TR3 I'd be tempted to use a keying relay unless you are really fast with the key.

Yes, I still have a watch with a radium dial. You can take a magnifier and watch the little radium atoms give their lives so you can see. The tiny pulses of light remind me of fireflies on an August evening. Radium is a primary alpha emitter, but it's daughters are beta and gamma emitters. The first breakdown product of radium is radon, a gas, so any radium that you have should be in an air tight container.

...

>Mike Owen W9IP

Well, I don't think the antenna polarization makes a whole lot of difference, on average, between two distant stations with like polarization. Sometimes one would be a little better or worse.

However, a bunch of us who actually operate on 220 and now 222 SSB and CW kicked this around at our annual picnic recently. The general consensus was that being horizontal had one major advantage: it reduces phase noise, etc. from FM and digital transmissions on near frequencies by the polarization loss, perhaps 20 db more or less. Since we are all jammed pretty close together now, this helps bandsharing and reduces inadverdent interference, even by responsible operators. It even helps some with less considerate ones, such as the group in Quebec who operate a repeater on 144.200 (SSB calling frequency) - carrier is clear 250 miles away.

There is also the PIA factor: we don't want to all change our antennae to vertical, so, Mike, make yours horizontal when you get it back up.

I would like here from SSTV,WEFAX,FAX users that are using
computers to receive/transmit these modes.

Is there a single board that can be installed internal/external
of the computer that can copy these modes?

What should the computer consist of? 286,386,486,SVGA,memory??

The last time I checked out SSTV the ultimate was a ROBOT 1200C
interfaced to a computer. That was 5 years ago and I am guessing
by now someone has put it all on a single card that can be
installed within the computer.

thanks,
Ken

Source record: 293914

Our family business is a garage, I have fitted a lot of radios of all types. I have recovered a lot of wrecks both burn outs and collision jobs. I've had to fix a lot of cases of interference too.

Car fires are quite common. Apart from carb. flooding and leaking fuel, most involve electrical problems. Accessory wiring is often the culprit, folk often don't use fuses. As someone said, thin wire can take surprising current before fusing, but IMMENSE currents are available. I have recovered burn-outs caused by broken engine to body ground straps, Attempting to start the engine creates a circuit incolving the starter motor, battery and choke/throttle cables. the current that flows even with a small (1 litre) engine's starter is enough to cause prolonged heating and then eventual fusing of the bowden cables thus starting a fire in the sound proofing felt. Fast fusing would maybe be safer as the heating period seems to serve to pre-heat any combustible material. An unfused radio ground would behave similarly.

I would never risk routing huge fault currents into the cab. there is a lot of combustible material in the dash-bulkhead area.

The seperate ground lead to the battery could sometimes act as an antenna to route noise to the set. Once stray L and C are taken into account, there is no such things as connection or isolation, we have to create an acceptable amount of attenuation.

My usual Recipe:

Ground the set to the nearest metal bodywork, use hefty braid.

Run a heavy cable to the battery + terminal. Fit a good quality fuse and holder at the battery end. If necessary you can screen this cable, keep it close to metalwork all the way, don't fly across open space, ground the screen at closely spaced intervals. Don't connect the screen to the battery - terminal groung it to the metalwork only. If you think that there is a problem with coupling via the common mode Z of the battery ground strap then you can beef up that strap. My only experiences of such problems were all due to poor connections, fixing them fixed the problem. Duff batteries can have higher internal impedance and contribute to alternator whine.

Grounding the bonnet (hood) only works well if well done, use heavy braid at both hinged corners. Reluctant cases have needed grounding contacts at the other corners.

The worst culprits nowadays are cab-mounted electronic engine controllers. Expect them to be close to where you want to mount your radio, to be grounded only via the most circuitous route and to be the centre of a web of wildly radiating (nice pun) cables. Fuel injector solenoid drivers and ignition coil drivers have fruity spectra and significant power. These are major problems.

It may be easier to fit a diesel engine than to fix some of these :-)
Try adding a well grounded metal screening plate.

Oh yes, and be very careful where you sitethat rig, I've met a number of people who were injured by poorly sited accessories. Amateur gear has not been given the soft and rounded treatment thac car radios have undergone.

GOOD LUCK !

Phil, kj6nn writes about the Palomar RBC700 series controllers:

>I have heard that the Palomar controller has everything is PROM. So if
>something needs to change you need to get new PROMS. Not sure if this
>is true. I do know the ACC controllers have EVERYTHING in E2PROM and
>that anything can be programmed to whatever you need!

Not true, the RBC700 series uses an EEPROM to store the configuration parameters. These parameters may be changed from the "ground" using proper security measures. It seems to me that storing EVERYTHING in EEproms would be not very smart. I assume that Phil is talking about configuration and NOT the controller firmware. I understand that the new single board controllers have replaced the EEprom with a battery supported NVRAM, this should provide several advantages.

>I also think the power requirements of the Palomar controller is very
>high. I think I read that the basic system is about 5 to 6 AMPs....
>With that much power in that card cage I would think a fan would be
>needed to keep it cool!

This might be old information. The RBC730 in use at wa6txy is using CMOS devices resulting in a power drain of much less than " 5 to 6 AMPs...."

One of the BIG plus's with the Palomar Telecom is the audio bus architecture that allows complete flexability in link operation. The ACC scheme has a number of problems when running in a true linked system. By this I mean a system with a number of remote base sites linked together by various means (wire line, 420 mhz, microwave). Each site has several connected radios along with the link radios. Any site may link thru one or more sites and control and use a radio several hops down the line without talking on the "talkback" at a linking site.

I do agree with Phil that a full featured controller such as the RBC700 or the ACC850 is overkill on a simple "kerchunk box" or non-linked system.

A happy RBC730 user,

Pete McAfee kd6hr

Try an inverted "V". We've had good luck with 150' legs spaced 180 degrees apart. Use a 50-300 ohm matching transformer mounted at the top of the tower. This will perform very much like a dipole. However, with proper matching, you can make it quite broadband.

Take care with exposed radium paint. The breakdown product of radium is
radon, a gas, and if you breathe this stuff you could be a goner from
lung cancer. Both are alpha emitters, so as long as you don't get any
inside your body you're ok. But it's difficult to avoid breathing while
using radio equipment.

}>It has been explained to me that the reason these receivers have no
}>meters is that the scales were painted with radium based paint to aid in
}>night viewing. The associated health impact of such exposure is well
}>documented and should be cause for concern.
}Is that the same glow-in-the-dark stuff as on old wrist watches and clocks,
}inside light switch handles, etc? The stuff that needs to be exposed to
}light to "charge" after which it glows for an hour or so, and gives off
}a greenish light? If that stuff is a well documented health risk, I have
}never heard of it. Or are we talking about different stuff here.

Yes it is different. The original WWII+ MIL spec. paint contained quite
a lot of Radium. The radioactivity was what caused the "glow in the
dark". Not the "blue glow" of intense radioactivity (e.g. Chernyobyl),
but a "radiophosphorescence" (sp?). THe radioactive decay caused anothr
material to glow.

Not dangerous enough to require lead suits etc., but you DO NOT want
that stuff in your house! A few milligrams (i.e. "grain of salt" size)
is enough to cause cancerous tumors if ingested into the body.

If you do have any old meters etc. with this thick yellowish paint (by
now it has probably decayed enough to stop glowing) then I strongly
suggest that you get rig of them - still sealed if possible. You should
contact your local county health dept. for instructions on proper
disposal too, don't just toss it into the trash to get into our (!)
water supply!

I don't know the makeup of the "light absorbing" paint, but as far as I
know it is not radioactive, just "normally" poisonous. :-)

> is and how to get hold of him pronto.

When setting policies you should keep in mind a couple of things that are real irritants to the press. One is the guy who essentially says "I don't know what I'm doing, I'll have to get the PR guy". Makes the people doing the work look incompetant. Another is that the photogs want pictures, not info. The "wait here until it's all over and then the PR guy will tell you what happened" attitude will ruin your good publicity.

The workers need to learn the difference between fact and opinion and be allowed to give the simple facts. "We're amateur radio operators and we're passing messages between this cammand post and the one at the hospital" will get you a much better understanding by the community than the "go talk to the PR flack" response.

Regarding use of torroids for telephone interference suppresion:

Try using a SINGLE torroid core with bifilar windings; one winding for the tip and the other for the ring. This is usually a common-mode problem and if you used two separate cores (one for tip, one for ring) it probably would have been ineffective. Make sure the windings are truly bifilar (both wound together in the same direction). Use different colored wires for each circuit (tip/ring) so you don't cross-connect them. Commercial versions of this device are becoming available.

Here's a copy of the Kenwood Service Bulletins dealing with some of the problems associated with the DG-1 on the Kenwood TS-820S....

SB-019

New Display Tube for DG-1 12-21-77

The original display tube (LD-8109) used in the DG-1 digital display for the TS-820 and TS-820S has been discontinued by the manufacturer. However, there is a replacement tube available. This tube is the LD-8135. It is not a direct replacement for the original tube. The leads come out of both ends of the display tube instead of just one as in the LD-8109. Therefore, it will be necessary to replace the complete display unit if the display tube fails. The part number of the new display unit is X54-1310-00. Please use this part number when ordering a replacement display unit. The new display unit is being installed in the current production of the TS-820S and DG-1.

The new display unit (X54-1310-00) is a little more involved to install than the old one. The installation is as follows:

1. Remove the top cover of the TS-820 (or TS-820S) and set the unit on the bench so the front panel is facing you.
2. Remove the two screws from the original display unit (save them), unplug the display unit forom the counter assembly and remove the display unit from the transceiver.
3. Run the connector of the new display unit through the left bracket (from the center).
4. Gently (but firmly) push the right side of the display unit throught the right bracket. (This is the most difficult part).
5. Gently push the left side of the display through the left bracket.
6. Install the screws from the old display in the mounting bracket of the new display unit and plug the connector into the counter assembly.

7. Turn on the TS-820 (or TS-820S) and make sure the display tube works properly.
8. Replace the top cover of the transceiver.
(c) 122177TKC

SB-024

General Notes on TS-820S 10-25-77

1. No output TX: SG switch is "OFF".
2. No TX, RX or VFO: There is no 9 Pin plug installed.
3. Low RX Sensitivity, no TX: The transverter switch is"ON."
4. S Meter full deflection when first turned on:
Makesure RF gain is not fully CCW.
5. If digital display does not count: Make sure DH is not"ON."
6. If there is no DG display: Make sure you are not in REMOTE VFO with no remote VFO attached.
7. When intermittant in any circuit:
a. Check for loose black jumper from point to point on circuit board.
b. Check for broken foil path.
c. Check for component that has been pulled out or loosely soldered.
d. Check for solder splash across foil path.
e. Check for loose pins.
f. Check for component leads touching to metal IF cans.
g. Check for wire not soldered at function switch or at any switch or control.
h. When checking FET's, check for excessive voltage at can top usually source, or same G-1, G-2 voltage.
i. Check for loose Molex mini connector or any foreign substance on pins.
8. Complaint of frequency shift when TX-CW: This is normal. 800 Hz.
9. Not proper PLL action: Make sure PLL slide switch is in NOR not TUNE.
10. Receiver audio self oscillation at high level: Make sure audio board mounting screws are tight.

RECEIVER

1. Low audio output receiver sensitivity and no transmit: -6v supply is bad. Q13 on FIX VOX unit.
2. 25 kHz calibrator will not zero: Add 3 pf in parallel with TC-1 on the marker unit.
3. Receiver sensitivity down: Q2 on RF unit. +9v on PD unit is shorted. L-6 shorted to ground.
4. Intermittant receive when moving set.: Check for touching terminals at final relay socket.
5. No receiver or digital: 14v wire pinched between DG-1 chassis and ground.
6. Receiver sensitivity 40 db down: Check for shorted L8, 1.8 MHz antenna coil on coil pack.
7. Adjacent signal interferance: See TKC bulletin.
8. No receive audio: Check for shorted TA-7201P module at X49-1080-00.
9. Poor receive audio: The 100 V AC 120 V taps were miswired.

10. Receiver doesn't work 20-40: Check for wafer touch to ground on band switch.
11. No DG1, no RX, no TX, no VCO: Bad D1 5 volt zener on relay unit.
12. RIT action seems warbly: See TKC bulletin.
13. Receiver has bad static and is noisy: Bad C14, C15, tantalum on PD unit.
14. VFO frequency shift: Check for loose tension of VFO tension spring.
15. USB/LSB will not work: Check for loose connection at C18 CAR-1 unit.
16. Intermittant audio: Check for loose mounting screws on audio board.

TRANSMITTER

1. Mushy audio on transmit: Mic amps Q20 and Q21 on IF unit are bad.
2. No 14V supply: Bad bridge diodes D8-D10 on X43-1090- 02.
3. Intermittant operation of any one band: Check for loosely soldered Xtals in PD unit.
4. Mic gain down: Cold solder joint at SSB xtal filter IF unit.
5. Self oscillation when TX: Bad final tubes. Burned cathode resistors 10 ohms R2, R3 at final unit.
6. No VOX operation. No sidetone: Burned resistor R12 220 ohms at key socket.
7. No USB or LSB: Check CAR1 X1-X2 crystal for cold solder joint on CAR-1 unit.
8. No TX: Check for shorted Q1 and Q8 balanced mixer on RF Unit.
9. No ALC meter movement: Readjustment of meter amp VR1, VR2 on IF unit.
10. Intermittant ALC action after peaking drive: One final tube is bad.
11. Fix lite on when in VFO position: Wire shorted terminals on function switch.
12. No loading of TX: Cold solder joint at relay socket RL1 antenna relay.
13. Using Sure 444 speech processor is distorted: See TKC bulletin regarding 16db pad for mic input.
14. No relay closure on TX: Q9 on fix Vox unit is bad.
15. Very low RF output only when using RF speech processor: Bad Q30 on IF unit.
16. Low RF output on SSB without RF speech processor: Bad Q20 on X48-1150-00.
17. Large audio difference between USb and LSB: realign carrier unit per TKC specifications.
18. No loading on 40 meters: Foil path is open on RF coil pack.
19. No tX when using send switch: Bad R28 1K and Q9 on FIX VOX unit.
20. Blows fuse: Check for shorted C21, C22 100uf 500v.
21. No drive, no TX or bias: Open screen resistor R6 470 ohm at rectfier unit.
22. VFO intermittant: Check for cold solder at VFO power plug.
23. Audio distortion on TX with processor: C96 may be loose on IF board.
24. Faulty LED indications: Check for loose ground screws on LED board.
25. Low output on CW: R14 470 Ohm touch to filter case on IF unit.
26. VOX operation is intermittant: Solder touch VS terminal oand 14v at X50-11350-00).

27. Intermittant TX: Make sure ground strap for 12BY7 shield is under the shield.
28. Insufficient power out to drive linear amplifier: An increase of 5-7 watts can be obtained by paralleling R6 on receiver unit with a 47 ohm 2 watt resistor.
29. VFO output level is down: Q2 inside VFO is bad.
30. No TX or RX on any band. No VCO output: Q14 on X50-1330-00 is bad.
31. No TX or RX: Loose contact VFO output terminal on Fix Vox unit.

(c) 102577TKC

2432. Re: How to get started???

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-06 17:11:58 UTC
From: smith@sndpit.enet.dec.com
Message-ID: <1552@sousa.ltn.dec.com>
Source record: 293749

In article <1991Sep5.160737.4766@uoft02.utoledo.edu>, grx0734@uoft02.utoledo.edu writes...
>I am very much interested in becoming a ham.
>I would appreciate if anybody could let me know how to go about it-
>which books to study for theory and regulations for hams in USA,
>what exams to appear for and when & where the exams are held etc. etc.
>(I would be starting from scratch.)

The question frequently comes up: "How do I get my Technician class ticket
(the one that doesn't require code tests)?"

The simple answer: "Call the ARRL at (203) 666-1541 and ask for their
Prospective Ham Package. They will take your adress and send you the
package customized for your zip code. It's not the most impressive package
I've seen, but it gives you a list of VEs in your area as well as
information on "What is Ham Radio?" and "How do I become a Ham?" and all
that."

The other simple answer: "Call the W5YI Group at (800)669-W5YI and ask for
their licence preparation material. I haven't had any contact with the
W5YI Group, but I'm told you get your ticket a little earlier when you take
your test at a W5YI session."

The more complicated answer: "You need to pass the Novice and Technician
theory tests at a VE session in your area. Talk to local hams (if you can
find them), check out your local ham store (if you can find one), or call
the ARRL. To get the study guides for the above tests, call the ARRL,
check out your local ham store, or go to Radio Shack for their part numbers
62-2414 "Now You're Talking" or 62-2413 "Nocode Tech License Manual" or
(62-2410 "Novice Class License Preparation" AND 62-2411 "Technician Class
Manual"). The Novice book will from Radio Shack will include morse code
practice tapes, and all of the Novice/Tech study guides will probably
indicate that you need morse code for your Technician license, but don't
panic! The FCC only recently changed the rules (as of February 15, 1991),
but you don't need morse code for the Technician class ticket."

I thought so too, until one night I looked at it with eyes adjusted to darkness for a long time. The glow is really faint, but enough to make the meters readable (only the needle and the numbers glow).

Really folks, does anyone have any hard data about the harm this level of radioactivity can cause?

George, KC6NDY

2434. Info on the MBR360 diode

Newsgroup: rec.radio.amateur.misc

To: Doug WA6VVV

Since I didn't see a way to E-Mail you direct, here's the info you asked for.

The MBR360 has the following specs per the Motorola book:
MAXIMUM RATINGS:
Peak Reverse Voltage 60V.
Average rectified forward current 3A.
Non repetitive peak surge current 80A.
Operating and storage junction temperature -65 to 150 degrees C.

Hope this is what you need...
Mike KE4PC

The currently manufactured "Glow in the dark stuff" is a very long persistence phosphor which is not radio active. They stopped using the very radio active radium some time in the early 50's. I have seen some compasses that use radio active tritium for a light source however recently.

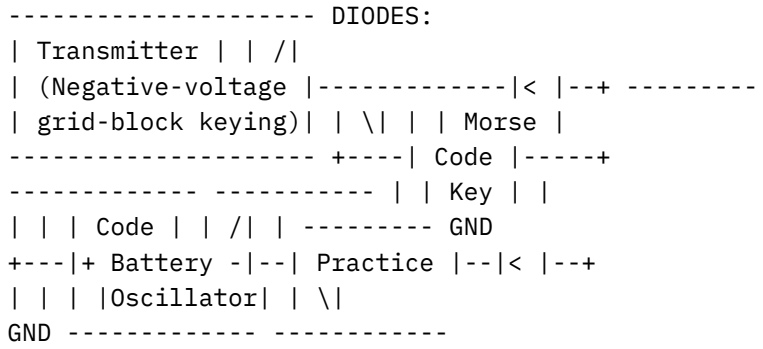
Let's see how good a vi'er I am...



Use your favorite oscillator or buzzer for the code practice
oscillator. The diodes can be regular 1N4000-series (1N4004, etc)
power supply diodes.

2437. Shopping in Silicon Valley

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-06 19:07:30 UTC
From: hoffman@cs.pitt.edu
Message-ID: <11692@pitt.UUCP>
Source record: 293889
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet

This year's ARRL Computer Networking Conference is being held in San Jose, right in the heart of Silicon Valley. If, like me, you come from an area where the state of the art in electronics parts houses is Radio Shack, a trip to Silicon Valley can be quite overwhelming. There are many places that you might want to visit, so I've prepared a list of them and then a small review of those that I visited on my last trip.

I started out by collecting the Yellow Pages listings under Electronics and Surplus and set out to visit as many of these places as possible. I've organized this into two lists. The first is a listing by town in counterclockwise order around the Bay and alphabetically by street within each town. It contains almost every company that was listed in the Yellow Pages. The second list reviews those places that I was able to check out personally.

Caveat: These data were collected in October, 1990, so some places may have moved or closed. Places that I have not visited may not even be parts retailers. I intend to check out some more of them this year.

If anyone has any additions, deletions, or corrections to this list, I would greatly appreciate them.

Besides the electronic parts houses, there are two other places worth visiting, but I don't have the addresses handy. First is the Exploratorium in San Francisco. This is a hands-on science museum that is great fun. I spent two hours the last time and didn't get to see even half of it, so I recommend allocating about five hours to see it all. Second is the Computer Literacy Bookstore. Any computer book you might ever want is here.

Have fun!

---Bob.

Mini-review of selected companies

A to Z Surplus, 980 S. Bascom Ave., San Jose
Test equipment and electromechanical surplus.

Ace 'Lectronics, 975 S. Bascom, San Jose
Surplus components, connectors, etc. Affiliated with Advanced
Component Electronics

Advanced Component Electronics, 911 George, Santa Clara
Advanced Component Electronics, 3479 Kifer, Santa Clara
A nice supply of ICs, connectors etc.

Alltronics, 2300 Zanker Rd., San Jose
Mostly surplus parts and test equipment. Some unique items,
such as electronic teddy bears and hamsters.

Anchor Electronics, 2040 Walsh Ave., Santa Clara
New parts, no surplus.

Arndt/Jameco, 1355 Shoreway Road, Belmont
Mainly a mail-order company. The showroom, if you could call it
that, had a couple of their PC plug-in cards.

Consumer Scientific, Inc., 1411 El Camino Real West, Mt. View
Items for the amateur astronomer and home scientist.

Fry's, 541 Lakeside Dr., Sunnyvale
Fry's, 440 Mission Ct., Fremont
Fry's, 340 Portage Ave., Palo Alto
What can one say about Fry's? It could only exist in Silicon
Valley and you've got to go there to experience it. All new
computers, parts, tools, TV, stereo, books, food, and personal
items. Literally one-stop shopping for your average hacker.

Haltek, 1062 Linda Vista, Mt. View
A very large assortment of new surplus parts, particularly resistors and capacitors. Some surplus test equipment and computer parts.

Halted Specialties (HSC), 3500 Ryder St., Santa Clara
A large assortment of parts, connectors and hardware, surplus and new.

Ham Radio Outlet, 2210 Livingston St., Oakland
Ham Radio Outlet, 999 Howard Ave., Burlingame
New and used ham radio gear.

J & H Outlet Store, 476 Industrial Way, San Carlos
Electronic and mechanical surplus. Metal stock.

JDR Micro Devices, 1256 S. Bascom Ave., San Jose
New PC-compatible boards and parts. I didn't see anything that wasn't in their magazine ads.

Al Lasher's Electronics, 1734 University Ave., Berkeley
New tools, parts and test equipment.

Lynn Johnson Electronics, 3480 The Alameda, San Jose
On each trip west, the days and hours seem to change, so I have yet to actually get in the place. They advertise in Nuts and Volts.

Mike Quinn Electronics, 1080 Langley (Oakland Airport), Oakland
Now _this_ is a surplus store! Dirty, junk piled up to the ceiling, and aisles so close that you have to be careful not to knock things over. It was great! :-) While I was there, they were unloading a complete VAX-11/750 system.

Minute Man Electronics, 37292 Fremont Blvd., Fremont
New tools, parts and test equipment.

Quement Electronics, 1000 S. Bascom Ave., San Jose
New parts, tools, TV, stereo, and ham radio. Looks like it might have been a grocery store at one time. Prices are high, which is probably why I've heard them referred to as the "Bascom Bandit."

R & D Electronic Parts, 1432 S. Main, Milpitas
New parts and tools.

Silicon Valley Surplus, 4222 E. 12th St., Oakland
I didn't get in here, either. There was a sign saying "Drug Zone" in that block and a little further down, there was a drug bust in progress. That was too much culture shock for this Pittsburgh boy so I decided not to hang around.

Weird Stuff Warehouse/Computer Surplus Store, 715 Sycamore, Milpitas
Good selection of new surplus connectors and ribbon cable. Lots of boards for various computers including an assortment of SASI/SCSI adapters. Used test equipment.

Did you try using a SINGLE toroid with the entire phone cord (all wires)
wrapped around it? If the interference is common-mode (probable), then
this would work better than using a separate toroid for each wire.

>Motorola part MBR360. I have not been able to locate any data on it.
>If anyone could tell me the current rating for it, I would appreciate it.

I believe it's similar to the MBR340 (40V, 3A, schottky power rectifier)
except rated for 60V.

Non-repetitive peak current (half cycle 60 Hz) is 80A.

Roger (and anyone else reading this)...

This newsgroup has been re-named to rec.radio.amateur.misc, but many
sites have not yet deleted the old group (rec.ham-radio). You'll get
a better response from the new group.

I'm looking for an owners manual and service manual for the Yaesu FTDX-560 transceiver. I would prefer to purchase originals, but I'll take good quality photocopies if need be. Let me know what you have and what your asking price is.

I'm also looking for an external VFO for this beast ...

There is a bogus file on how to do this that is being passed around
the BBS community at present. The file actually advises you to go
to your local electronics store and buy a ROM chip and replace the
programmed ROM on the modem with this presumably blank one!

Don't do it.

The file also has someone's name and phony Compu$erve ID on it.
The ID has too many digits!

Two routes as I see it. 1) The swap meet scrounge - look for cheap used
equipment. 2) Maximize your knowledge flow while minimizing your cash
flow - junk box construction.

>I guess most stuff
> would be homemade, and the receiver would be an antique.

No problem, there's a club that has contests with antique equipment.
You get bonus points for running gear older than certain dates.

> How does one check out a homemade transmitter, without access to $100K worth

> transmitting in a portion of the band that -seems- free, based on your
> simple equipment, but end up clobbering someone else's transmissions that
> you can't hear, what sort of reaction will you likely get?

Since this is a normal occurence, you should get a reasonable response.
But if you don't, you can take satisfaction in the fact that the guy
giving you a hard time probably bought his radio assembled (and maybe
even bought his license) and couldn't tell a pl-259 from a hole in the ground.

> What if you
> accidentally spill off the edge of the legal band, because your frequency
> scale is out of calibration? Do they send the goon squad after you?

Yes, they will. In the old days, they used crystal calibrators. This is
a (usually 100 KHz) crystal oscillator that put out a lot of harmonics, hooked
up to, or built into the receiver. These days, with digital divider chips, you
can make a simple circuit that will put out harmonics at whatever frequency
you need to keep your frequency dial accurate.

If you're using old equipment or simple circuits, look at some old books
and magazines to see what sort of techniques they used.

I have the same problem, and would be *MOST* interested in any suggestions. One that I can rule out, however, is using coax for the phone lines. I wired my house with coax for just this purpose... I can still send ssb to my phones (note: my rig is a 2kw pep rig)

2451. Ear Mike Source

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-07 07:01:39 UTC
From: rja@batcomfs.Eng.Sun.COM
Message-ID: <19660@exodus.Eng.Sun.COM>
Source record: 293909

Here's the info on the high quality earmikes I mentioned. This information is from a 1+ year old flyer, but hopefully will still be good:

The company which makes them is Magnum Distribution Inc., 3-245 H. Street, P.O. Box 8008, Blaine WA 98230. Telephone 206-676-7775. Price was $299 for the ear mike and switch, plus $60.00 for the radio to switch-unit interface cable (specific to your radio). The product is the EM-200 ear mike.

An SF Bay Area local rep was Al Olshesky, or Chris Doyle in Campbell, at 408-378-6003. (Olsheski & Assoc., 1506-C Dell Ave., Campbell CA 95008)

There is no substantive information in S/N ratios, etc., but the review I read of the equipment said it was military tough.

>Ray tells me they are inundated with filter upgrades, and they have one
>technician who must do repairs, upgrades on other models, and ... oh, yes
>... R1 filter upgrades. I was promised mine would finally be done last
>week. We'll see.

I got mine back from RAYCOM about two weeks ago after sending it across
the pond in June. I find that the radio does have less bleed through
as expected, but it also has decreased sensitivity. I haven't had the
opportunity to accurately measure the sensitivity yet, as my friend
with the wazoo signal generator has been unavailable for the test (I think
he went on vacation and his generator is on loan ;-( ). When I can
make the measurement, I will post to the net the results of both
an unmodified R1 as well as the results from three that were modified.

I personally find mine to be a lot more tolerable after the mod. Here in
Silicon Valley five of us got together to send off our radios so as to
save money on the shipping. It worked out something like $125.00 each
for the shipping and the mod mainly because like Mr. Schuster, we made
several calls to Jolly old England to try to understand why "they will
be ready in the next couple of days" seemed to really mean a couple of
months.

Out of the five radios, one appears markedly damaged: the radio refuses
to break squelch on AM mode and fails to pick up all but the very
strongest stations, quite disturbing to the owner I might add. We plan
on measuring all of the radios (at least three) to see what has happened
to the sensitivity of the ones that seem to work OK as well as the one
that doesn't. Although Raycom provides a warrantee on their work, the
fellow with the one that is "broken" I don't think is too interested
in sending off his radio again. I guess after waiting for two and half
months and getting a pile of junk back, he doesn't want to fork over
another $50 to $75 for two way shipping:-(

Again, mine seems to work OK and in fact the intermod or bleed through
problem appears much improved. However one out of five coming back
in sad shape is very disturbing. Stay tuned for more.

>
>The RAYCOM mod switches in an ADDITIONAL "roofing filter" in N-FM and AM
>modes. This completely eliminates the 150 kHz adjacent channel bleed-through

2453. Re: Antenna Advice *** Magnetic Loops ***

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-07 12:40:21 UTC
From: sid.boyce@amail.amdahl.com
Message-ID: <m0kJ1wD-0000EhC@juts.ccc.amdahl.com>
Source record: 293915

Recently I saw an article on the net from someone in Hawaii using
the AEA Versaloop antenna and was very happy with the DX performance.
My brother moved to Florida from the wastes of Sasketchewan to find
that in his temporary accommodation, he could not put up an antenna, I sent
him a wide-spaced split-stator capacitor and some plans for a loop 3 feet/
1m diameter (not critical, other than it must be less than 0.25 wavelength
at highest freq). His Tx is bust, but on receive he had no trouble in copying
the Dx from Europe.
Myself, I have used one for 80/40m and with low power, have worked all
over Europe (20W max). The biggest signal is GW4OGP who makes/sells loops
to hams/Governments, too pricey!, Tony uses a 12ft dia loop on 160/80 and
works all over the world using up 100 - 400W.
The original article (GW4OGP disputes this) was in QST June 1986 by
Ted Hart W5QJR ... he also has a book ...Small High Efficiency Antennas -
Alias The Loop.
The first loop I saw was a demo from GW4OGP, I was intrigued and when
I built the first one after being urged to do so over the air by few UK
hams, I still found it hard to believe.
The loop looks like a toy antenna, but it really performs, again this
idea seems a hard starter in the US, but it is in common use in the UK and
some countries on the Continent.
1. It is simple to build and setup, **** CHEAP ****.
2. No tuning unit!!! It cannot be used with one, it is tuned via its
capac-
itor.
3. Does not need height, 3ft above ground usually. Best clear of surround-
ing objects, and people/animals (radiation hazards as usual).
4. NEEDS to retuned every few Khz because of its high Q and narrow band-
width... slow motion drive 10:1 adequate.
5. NEEDS a widespaced capacitor, voltage is about 5kv for 100Watts.
I exhort you to get the article, even with a receiver-type capacitor (10W
max), you can experience something new in this amazing hobby.
I hear tell of the good old days of amateur radio, I build almost everything
in my shack, I don't think the hobby has ever been as interesting and I also
believe it is just awakening.
73......Sid.....G3VBV.

Interesting. Ray said the sensitivity would be diminished =ever so slightly=
but that I shouldn't notice it. Quoting from the review in Scanners
International (November 1990, p.13):

"The measured sensitivity of the set, i.e. its capability to receive weak
signals, was virtually unchanged when compared to the earlier tested model,
both versions being very good across the entire frequency range."

>I personally find mine to be a lot more tolerable after the mod. Here in

Just curious: how did you pay? I was told they could use my VISA card
(Access?) and I've been checking my online banking for a charge. I wonder
if it's been faster if I sent an international draft. Did you have any
problem with payment?

That is most alarming. I wonder if RAYCOM will "make good" on it. Also,
wonder if they'll consider selling R1's =already= upgraded and tested.

>Based on my experience, you have about another 3weeks to a month to wait!

<<sigh>>

* STS-48/UARS LAUNCH ADVISORY *
==============================
NASA managers have targeted Sept. 12, 1991, for
launch of the Space Shuttle Discovery and its primary
payload, the Upper Atmosphere Research Satellite (UARS).
The announcement came at the conclusion of today's Flight
Readiness Review for mission STS-48 at the Kennedy Space
Center, Florida (KSC).

The launch window on the 12th opens at 6:57 p.m.,
EDT, and can be extended for approximately 2-1/2 hours.
If the launch is postponed the window will open
approximately 20 minutes earlier each day. A nighttime
landing is expected at KSC which has been designated as
the primary landing site for this 5 day 7 hour flight.

UARS is the first major flight element of NASA's
Mission to Planet Earth. UARS will study winters in the
northern hemisphere and the Antarctic ozone hole during
the satellite's planned 20-month life.

The 5-man crew for Discovery's 13th mission, the
43rd Space Shuttle flight, will be commanded by 48-year-
old Navy Capt. John Creighton. He and Pilot Kenneth
Reightler, 40, a Navy Cmdr., will be joined by three
Mission Specialists: Charles (Sam) Gemar, 36, an Army
Lt. Col.; James Buchli, 46, Col. USMC; and Mark Brown,
40, a USAF Col.

* MIR NEWS *
============
The folllowing news items come from the U5MIR-1 packet radio BBS on Mir
by way of Dave, N6JLH, who translated the text for SpaceNews:

Subject: NEWS

30-31 Aug

Next experiment with gallium arsenide in oven GALLAR (T > 1200 C).
(Before docking PROGRESS, we did an experiment with cadmium sulfide
120 hours at T > 1000 C in oven KRATER). We are preparing to work
with 2 cameras with 300x300mm exposures. (Film) will be returned
to Earth by capsule after undocking PROGRESS.

31 Aug

Checking ultraviolet telescope GLAZAR-2 after repairing. Star
calibration pictures were taken and we checked on the possibility
of deflection after replacing the isolation mechanism. The test was
successful. Now GLAZAR-2 works ok.

* MAGELLAN NEWS *
=================
Magellan Discovers Landslide

Well, Magellan's at it again. At a new conference held today at JPL, it was
announced that a giant landslide was discovered by Magellan. The landslide
was apparently triggered by a earthquake (venusquake?) that measured about
5 on the Richter scale, and the landslide measured 1.8 miles wide and 4.7
miles long. The image was taken on July 23 by Magellan, and the landslide
was not there when Magellan was over the same spot last November. This
marks the first time that a change in the surface of Venus was detected.

[Story by Ron Baalke @ JPL]

* SATELLITE OF THE WEEK *
==========
The "Satellite Of The Week" feature is in response to numerous requests
for amateur satellite transponder passband and beacon frequency information.
All active amateur satellites will be covered in upcoming weeks.

Name : LUSAT-OSCAR-19, NASA Catalog Number: 20442, Launched on 22-Jan-90
Orbit : Low-altitude, circular, sun-synchronous, near polar

LUSAT's primary objective is to provide the worldwide community of radio
amateurs with a satellite-based digital store-and-forward packet radio
message system in low-Earth orbit.

Uplink frequencies: 145.840 MHz
145.860 MHz Uplinks are Manchester-encoded 3.5 KHz
145.880 MHz deviation FM.
145.900 MHz

Downlink frequencies: 437.153 MHz (primary, raised cosine BPSK modulation)
437.125 MHz (secondary, BPSK modulation)
70 cm CW Beacon: 437.127 MHz (12 WPM CW Telemetry, 750 mW)

+++ UO-14, AO-16, DO-17, and WO-18 were all launched together along with
LO-19 on 22-Jan-91 UTC, not 22-Feb-91 as reported in previous issues of
SpaceNews. I'm surprised no one caught the error! The incorrect launch
date was taken from the latest edition of "The Satellite Experimenter's
Handbook", by K2UBC. Sorry for the inconvience!

* TNX FOR RPTS! *

In article <16610050@hpqmolm.sqf.hp.com> dstock@hpqmolm.sqf.hp.com (David Stockton) writes:
"PARIS " was chosen as the standard length word for speed measurement.

Nobody seems to mention this, but "WORD" has exactly the same number of unit times as "PARIS". This is especially nice, since n words per minute is n "WORD"s per minute.

I tried to order Hart's book something like a year or two ago and
never received it. The distributor (same one that used to put out
AntennaX?) apparently went QRT. But, those interested in the Hart Loop
can look up the ARRL Antenna Handbook, where it is described in good
detail.

SB DX @ ALLBBS $KT7H249
RTTY DX Notes 1of3 9/6/91
RTTY DX Notes for week ending 6th September 1991
BID: KT7H249
Part 1 of 3.

It seems to me that there are a lot of mentally deaf and blind people
out there. I am not referring to those who have a physical
disability, but to those who will not see and hear. As a matter in
point, while you are in contact with a station, someone will come up
and call that station even though you are still working them, causing
deliberate interference. Surely they must be able to hear and see one
of the stations in the QSO, otherwise they would not start calling
them. But I guess that some people will never behave like gentlemen.
I saw a station do just that during the week, while someone was
collecting his mail. Then the interrupting station pulled every
bulletin that the mailbox had, not once, but twice. Maybe they were
trying to say something. Who knows or cares.

Our thanks this week go to DJ3IW and the DB0SPC DX Cluster, IK5AAX,
I5FLN, LZ2BE, K4FJ, OD5NG, TG9VT, VK2EG, WB2CJL, W2FG and the Tri-
State DX Packet Cluster Network and W9RY/7. Thank you all for your
interesting information. We hope that you work some of the good DX
that has been reported.

RTTY DX Notes 3of3 9/6/91
RTTY DX Notes for week ending 6th September 1991
BID: KT7H251
Part 3 of 3.

QSL Information:

7Z1IS will QSL via OE6EEG.

RI1OA will QSL via Box 9, Namangan, Uzbek 716000, USSR.

UW3DF is in Kaliningrad and will QSL via Box 88, Moscow.

RO5OC says to QSL via DL5EG.

Notes of Interest:

XY0RR has been active on 20 and 15 meters SSB and CW and says that they will be on RTTY for the last two days of the operation. When asked when that was likely to be, Romeo said possibly around the 8th. So I will be looking from today onward.

St Brandon Island. The operator is on the island and is setting up aerials. He expects to be there for about two weeks, but may be fairly short of operating time.

JT/KC7V and group will mainly concentrate on 40/80 meters during their stay, but they have been operating on 20 meters RTTY. They will leave the RTTY gear for the JT boys after they depart around September 8. They will run RTTY when time permits.

UL7PCZ will be operating during the CQWW Contest as UW2F, then for three or four days after that he will sign RA2F/UL7PCZ.

LW1DBY is a special call for Argentina.

ZL1AMO is planning a trip to ZL8 in March, if he can get the funding.

VP8CFM (South Orkneys) says that he will operate RTTY if some gear can be found for him. W6PQS is trying to arrange some gear, but it could be late November before it can be delivered.

Message-ID: <CRBANYAN.WENEWKIR.7358.1991.090713.0613.06>
Source record: 293921

>There is a legend, myth, or just plain ole folk tale in these parts that some
>of these "young ladies" would paint the stuff on their teeth to surprise their
>boyfriends at the drive-in (remember those). The radium plant was located in
>Dover (or Wharton), NJ and has since closed its doors. I rather doubt that any
>of those ladies are still around to tell tales of those days. Gives new
>meaning to (literally) "glow-in-the-dark." 73, Walt - K2WK.

There was a program that ran a few years ago on Cinemax called "Radium City"
and was a documentary on Ottawa, Illinois. I don't know if it's available
separately (was called a "Cinemax Documentary") on videotape. Had a history
of the Radium Dial Company and Luminous Processes plants in the city. Rather
striking picture of the landfill where the Radium Dial plant was buried when
it was demolished -- the area where the building is buried melts the snow on
the ground above it.

Interviewing one of the surviving workers of the Radium Dial plant, Marie
Rossiter did say the girls would try to finish their production ahead of
schedule and paint themselves up and head down to a darkroom located near the
work area and make faces at each other.

2461. Elmers List being reposted (assumed lost)

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-07 18:32:00 UTC
From: acm005@zeus.unomaha.edu
Message-ID: <9109071833.AA07471@ucsd.edu>
Source record: 293922

The UNO Computing and Data Communications staff members in charge of news have informed me that the new News software being used on the academic Vax has had severe problems communicating with the NNTP site at kuhub.cc.ukans.edu. As a result, the software on the UNO side core-dumped and new posted to the system during that critical weekend may have been lost.

Since the previous posting hasn't echoed back on the Info-Hams list and no one has reported its appearance, I am going to repost them via the UCSD Gateway, to avoid similar problems. Apologies if your site winds up with 2 copies.

Enjoy!

[Last Modified: 31 Aug 91]

SPECIAL NOTE: It has come to my attention, directly and indirectly, that this list is being reprinted and/or summarized in other newsgroups and electronic forums. I really don't mind this, but would appreciate advanced coordination. This will allow me to keep tabs on its distribution, monitor inappropriate uses (i.e. use for profit or as part of a copyrighted work), prevent duplication of effort, and maintain version control and accuracy everwhere it appears. If you would like to become an "official" distributor of this list to another forum, send me E-mail, and I will send you the latest copy each month. The following is a list of "official" distributors. If you are reposting this directory and are not on the list, I would very much like to hear from you.

Newsgroup/Forum/Archive	Submitter/Moderator	E-mail address
comp.archives	Ed Vielmetti	emv@msen.com
news.lists	Gene Spafford	spaf@cs.purdue.edu
Compuserve Hamnet	Scott Loftesness	sjl@glenbrook.com
ftp.cs.buffalo.edu	Devon Bowen	bowen@cs.buffalo.edu

A Brief Historical Overview:

If there is any one constant in the changing state of the communications art, it is that "hams" have always been on the forefront of it. Rumors abound where the term "Ham" came from. Some of the more amusing include:

the acronym "Home Amateur Mechanic" or...

from the Cockney pronunciation of "L'amateur" or...

the initals of the founder of the American Radio Relay League, Hiram Maxem, W1AW (his actual middle name being Percy apparently notwithstanding) or...

from the call letters of one of the first amateur stations at Harvard, H.A.M. (please, no flames from W1XM at MIT)

Knowledgable individuals from the ARRL, and other radio historians, seem to agree that the terms "Ham" and "Lid" (an inept operator) both originated with landline telegraphy. A "Ham" was a show-off and a "Lid" was a telegraph operator so inexperienced, he had to use a pot or can lid to rest his telegraph sounder on to properly copy the code.

Regardless of origin of the name, a "Ham" is universally recognizable as one who experiments in radio and communications.

Whether it be constructing a low-power CW radio with vacuum tubes, or designing TCP/IP packet networks, such experimentation has historically spilled over into the mainstream such as was the case with Edwin Armstrong, who developed the regenerative oscillator and FM radio, or General Curtis LeMay (K6LEW) who was instrumental in making Single-Sideband the communications standard for the Strategic Air Command and eventually the U.S. Air Force. Although packet-switching techniques originated from DARPA (Defense Advanced Research Projects Agency) and the ARPANet, no one can deny the trememdous influence that amateurs have had in demonstrating the viability of TCP/IP and AX.25 communications via radio links. The efforts of AMSAT (the Amateur Satellite Corporation) including the development of many ham satellites and the low-orbiting Microsats (communications satellites no bigger than a breadbox that use store-and forward packet techiques) has certainly "advanced the state of the communications art," one of the defined purposes of the Amateur Radio Service, as recognized by international treaty.

Since in many cases hams are writing "the book", there is often no "book" or other established reference for a beginner to refer to. Traditionally, information has been passed on from ham to ham via word-of-mouth. Like many of the traditional crafts, a variation of the Master-Apprentice system has emerged, the Elmer-Novice relationship. Called "Elmers" because they are usually older and wiser, having the benefit of many years in the hobby, including several failed projects, and an electric shock or two, they have traditionally been the mainstay of the hobby, and the source of many new hams, particularly those interested in working on emerging technologies.

What is an Elmer today?

An Elmer today is of any age, male or female, who has some expertise and is willing to share it with beginners. Elmers don't even need to be licensed amateurs, just people with knowledge in some area of electronics or communications technology.

What is a Usenet Elmer?

With the ever-widening scope of the Internet, and the amateur radio newsgroups on Usenet, the potential for Elmers to share their information to a wide audience has never been greater. To that end, I have started to maintain a list of such Elmers. Volunteers need only send me their name, E-mail address, and area of expertise.

Naturally, the more that volunteer, the more the work is distributed. If upon volunteering, you are unable to meet your obligations, simply write to me and I will remove your name from the list. I could also add that because of "personal committments" or "career broadening" you

no longer are available to Elmer on a regular basis.

I will be the point-of-contact for this project. I will maintain the list, post it to the groups on the first of each month, and have the latest copy placed in the supplemental archives at ftp.cs.buffalo.edu in subdirectory ~/pub/ham-radio.

Those desiring a more extensive list, or who need more specific assistance, are encouraged to contact Rosalie White, WA1STO (no arrlhq.UUCP mailbox yet) at the American Radio Relay League, 225 Main St., Newington, CT 06111.

The latest version of the list can be found in the companion posting to this message, "Monthly Usenet Elmers Resource Directory." If you sent me mail and are not on it, please resend as it may have been lost on the way or once it reached my host.

Currently, the list is over 30 Elmers strong, has been featured in informational postings in the comp.archives and news.lists newsgroups, and has become an invaluable resource for many, as well as an opportunity for the volunteers to share their knowledge. Thanks to all the volunteer Elmers, as well as courteous list users, for making this service a success.

My skills are listed below in no special order
- PC RFI reduction (Wrote a chapter for the new ARRL RFI BOOK)
- Repeaters (How to put one up)
- Repeaters (How to use one, without making others mad)
- 1.2 GHz (My repeater is on this band)
- VHF packet only (I hate HF packet)
- HF DX
- HF AMTOR, RTTY, ASCII
- Putting up a tower and/or HF beam

I can provide advice & assistance to any hams (or prospective hams) who
might be interested in things like reciprocal licenses, the differences
between European and USA Bandplans/operating practices etc.

Similarly, where to go in Britain to take ham tests, how to get
information on joining RSGB or local radio clubs, details of
hamfests/swapmeets etc. over this side of the pond...

Also advice on old tube-type radios (from the 1940s to the 1960s) and
'low budget' radio - converting commercial VHF 2-way dispatcher radios
to work on packet etc.

2465. Solar Bulletin - Reply to a Concerned Individual - Please Read

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-07 19:29:32 UTC
From: oler@hg.uleth.CA
Message-ID: <0094E49F.610AAE40.8746@hg.uleth.ca>
Source record: 293926

For those of you who may be concerned regarding the fate of some of the other products which have appeared over the nets, I would like to present a message which we received from a concerned individual, together with our response. I believe the questions and concerns posed by this individual are good ones which may help ease concerns others may have. I want to thank this individual for expressing his concerns.

The conversation follows:

> As an example, the "broadcast" contained the following:
>
> > WARNINGS=*MAJFLR;*PROTON;*PCA
> > ALERTS=**PROTNENH;**PCAENH
>
> Now, that's the first I've heard from STD of any of the warnings or
> alerts. Is that because of computer/network problems or is it because
> the text warnings and alerts will no longer be issued? I hope that
> it's not the latter.

The text warnings and alerts will still be issued, but they won't be quite as verbose as they previously were. NO alerts, warnings or reports have been posted over the nets lately due to our reshuffling. This is why you have not seen the latter. Please note that there are some alerts and warnings included here that are NOT sent over the nets. We don't place all of our products over the nets. To do so would cause too much congestion.

> Another point that's been raised is the "fate" of the
> somewhat-irregular "Forecast and Review" - a most-valuable document!

Don't worry about that either. The weekly (and it will be a regular weekly) STFR will continue to be an integral part of our services. The only thing we will be doing different with those reports is removing the textual descriptions, or scaling them back a fair bit. In place of the textual descriptions, we will be adding a few new graphical charts, including an analysis of sunspot numbers and an anlysis of the 90-day average solar flux, which is very useful for determining relative MUF trends. In fact, this weeks weekly will be released today sometime (it is a bit late, but that's due to our reshuffling).

> I can quite-understand why you have discontinued the daily summaries
> (even though they were excellent) - I had been wondering how long you
> could keep up that level of documentary output on a daily basis.
> However, I cannot help but regard it as something of a step backwards
> in view of your (realised) aim of making solar-geophysical matters
> comprehensible to the layman. Perhaps we've been spoiled by everything
> that you've done so far!

{ This comment was referring to our Daily Summary of Solar Terrestrial Activity, which is only available through our mailing list in order to keep net congestion down. Interested persons may subscribe by sending a request to: Oler@Hg.Uleth.CA, or to: COler@Solar.Stanford.Edu. The daily summaries contain daily textual summaries of the more notable solar and geophysical phenomena which occur each day. They are also available on our BBS. }

The daily summaries will perhaps see the most notable change. The daily summaries will begin with a copy of the daily data sets and will be followed with a textual description of some of the more notable events which occurred during the UT day. There won't be as much text, but there will be descriptions given. We wanted to keep the textual descriptions part of the daily summary in order to compensate for a lack of textual descriptions in the weekly STFR report. So really, you won't be losing much except some of the verbosity.

> This "criticism" (which is based partly on conjecture because I don't
> know what is planned) is meant to be constructive - I hope that it
> appears that way - but it should, perhaps, be better described as a
> "reaction".

I understand and thank you for your comments. I hope I have been able to calm some of your fears. You may want to send a copy of this message to the others in your group, since I'm sure they are probably having similar concerns. Basically, all that we've done is the following:

- Created the new daily data broadcast service (mostly to enhance the distribution of data to professional institutions, but also to provide the more popular indices to the public).
- Removed the text from the weekly STFR report and left the rest as-is (in fact, additional charts have been ADDED to the STFR report, including a graphical analysis of sunspot numbers and an analysis of the 90-mean solar flux values, which is good for indicating the general trend of solar activity and can even be very useful for indicating the trends of MUFs - as I mentioned above).
- Scaled back the text in the daily summaries, prepending them with a copy of the daily broadcasts, but retaining a less verbose textual description of notable events which occurred during the day.
- Scaled back the text in the alerts and warnings.

One other minor additional service we have added is the "Middle Latitude Auroral Activity Watch" and the "Middle Latitude Auroral Activity Warning." These are identical to the low latitude versions, but are applicable for the middle latitudes.

So I hope you can see that we have been quite busy reorganizing things. We should be back into full operation sometime today.

By the way, the proton and PCA enhancements were minor and may end today. The associated warnings could not be posted on the nets since the phenomena occurred during our reorganization, but you guys really haven't missed much.

The data sets you will be receiving will take some getting used to. In order to keep the space used low and the information content high, we had

to adopt that rather "cramped" format. I hope that you and others in your group will realize that these data sets contain technical information that is being used for important research projects by other organizations and institutions. It will be most valuable to those who understand the data. For those who don't, there's always room to learn.

Just a quick example for you and your group. Look at the PCA data line now and then and compare radio propagation conditions for signals that pass through the polar regions. You'll soon learn that PCA levels do not have to be very high to cause strong degradations in polar path signals. Now, look at the SWF stats and you'll be able to determine quite well the susceptibility to daytime SWFs. Look at the average x-ray flux. You'll notice that higher average x-ray levels often produce noisier radio conditions during the day. They can also often produce respectable enhancements in the MUF. The background x-ray flux can also be used to determine the strength of the ionosphere. Higher values strengthen the ionosphere. Look at the neutron stats to determine the strength of global geomagnetic disturbances. Large decreases in the average neutron counts (ex. decreases below -5%) are almost always associated with respectable geomagnetic storms and are also associated with ionospheric storms. When the average neutron count rate climbs back up to (or above) the 0% mark, ionospheric conditions are usually near normal. Levels below 0% usually indicate a weaker ionosphere and hence, poorer propagation conditions. Neutron levels have also been correlated with lightning activity for you weather buffs.

There is a HUGE amount of information in these daily data broadcasts that are applicable to areas from atmospheric (meteorological) physics to geophysics to ionospheric physics to space-plasma physics, etc. You would be surprised how much of the information in these data sets apply to radio communications.

Perhaps it would be wise if we developed a brief "applications" document to help people understand how to apply some of the information.

Again, thanks for your comments. I hope this message has eased some of your concerns. Best regards.

-Cary Oler

2466. Re: Shopping in Silicon Valley

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-07 19:45:05 UTC
From: jerryp@key.COM
Message-ID: <2819@key.COM>
Source record: 293830

Just a quick followup to the Silcon Valley shopping list:

Ham Radio Outlet in Burlingame has apparently moved to Sunnyvale
close to Frys.

Don't forget "the Garage" on West San Carlos street, near the
convention center (is that where the conference is going to be?)

The Garage is predecessor to the High Tech Museum. Its primarily
for kids, but what the heck are hams but big kids with expensive
toys :-)

Recommendation: If your at the convention and don't have time to
do anything else, drive north on 101 about 10 minutes to Lawerenc
Expressway. There you can hit Frys, Wierd Stuff, HRO (I haven't
been there yet -- Grand opening Sept. 14) HSC (Halted?) Computer
Literacy and god knows what else, all within about a mile of
one another.

Go nuts.

2467. Solar Bulletin - Voting Results for the Proposed Service

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-07 22:14:23 UTC
From: oler@hg.uleth.CA
Message-ID: <0094E4B6.68529340.8915@hg.uleth.ca>
Source record: 293831

/\

SOLAR TERRESTRIAL BULLETIN

07 September, 1991

Results of the Vote for the Proposed
New Service

/\

RESULTS OF THE VOTE FOR THE PROPOSED DAILY BROADCAST OF ACTIVITY INDICES:

The main bulk of votes regarding the proposed new service to provide a
brief (very terse) daily broadcast of solar geophysical indices have been
received and tabulated. The results appear below:

In Favour Not In Favour
--------- -------------
93.6 % 6.4 %

Votes Received Votes Received
-------------- --------------
282 18

Judging by these results, it appears that there is a strong desire for
such a service over the public nets. We will, therefore, implement this
service over the nets. For those who were concerned about using too much
bandwidth on the public nets, you will be interested to know that the daily
data sets will consume only approximately 1K bytes worth of mail space and
will not ever exceed 1.5K.

To begin with, broadcasts will be placed on all of the newsgroups which
currently have been receiving the solar warnings and reports. Some time
later, there may be an opportunity to move this data to another group
dedicated specifically to broadcasts of pertinent information to the public
(ex. no conversations, a strictly moderated group). Please bear with us until
a transition can be made.

As was mentioned in the bulletin requesting comments, this daily
broadcast of solar geophysical indices will be brief and to-the-point. It
consists of a 15-16 line message with a respectable amount of information on
each line.

Please note that this data is also being sent to research institutions
and professional organizations for practical important applications. The
format and content of the data was chosen to provide sufficient information
for these organizations as well as to provide all of the "popular" data used

by amateurs, such as the sunspot number, solar flux, etc.

When you first begin receiving these data sets, expect to see quite a few foreign numbers. A descriptive text explaining each line of the report in full detail will be sent out over the nets. This file will also become available for anonymous FTP on 'solar.stanford.edu' (in the "pub" directory) and on 'nic.funet.fi' (probably in a directory near "pub/dx/solarreports"). This descriptive text will be sent out every two to four weeks to begin with, until the format becomes more familiar.

If all you're interested in is the solar flux, or the sunspot number, then locating the appropriate data in these data sets will be a snap and you can ignore the rest. If you're interested in learning more about the quantities which can affect radio propagation (for example), these data sets will prove to be invaluable in your personal research.

We have software available (for IBM or compatible systems) which will automatically extract the information from the messages you receive and display it in a friendlier format. The program will also archive the data to disk and will generate historical reports or charts from the archived data. For more information on obtaining the software to make interpreting this data easier, send a request for additional information to: Oler@Hg.Uleth.CA, or to: COler@Solar.Stanford.Edu.

The daily broadcasts will become operational over sci.space and the amateur radio newsgroups within the next 24 hours. Thanks to all those who responded to our call for comments.

** End of Bulletin **

2468. Major Solar Flare Alert - X-class - 07 September

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-07 22:49:37 UTC
From: oler@hg.uleth.CA
Message-ID: <0094E4BB.54A517A0.9063@hg.uleth.ca>
Source record: 293832

/\

MAJOR SOLAR FLARE ALERT

ISSUED: 22:30 UT, 07 SEPT

/\

Low Impact Possible

MAJOR ENERGETIC EVENT SUMMARY:

Flare Size: Class X3.3/2B Location: S11W50 (Region 6818)
Tenflare: 280 sfu at 1920 UT Times: Begin=1920, Peak=1927, End=1958

Sweeps: Type II (Importance 2) at 1930 UT, Duration: 26 minutes
Continuum Emission observed at 1956 (Importance 1)

NOTES: An impressive geomagnetic crochet was observed with this event over the low and middle latitudes in the sunlit regions. A moderate to strong intensity SWF (Short Wave Fade) accompanied this flare.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT:

There is only a very slight chance for a terrestrial impact from this flare event. If an impact does materialize, it is expected to be low in intensity.

UNDERSTANDING THE DAILY SOLAR GEOPHYSICAL DATA BROADCAST
--------------------------------------------------------

Revision 1.0

The Solar Terrestrial Dispatch (STD) has begun providing a daily
broadcast of solar geophysical indices over the electronic networks. A
sample broadcast message follows below. This sample broadcast data set will
be fully described in this document.

!!BEGIN!! S.T.D. Solar Geophysical Data Broadcast for DAY 248, 09/05/91

!!END-DATA!!

LINE 01
-------
!!BEGIN!! S.T.D. Solar Geophysical Data Broadcast for DAY 248, 09/05/91

!!BEGIN!! : Signifies the start of the report, for computer-controlled
extraction of the data.

DAY 248 : The day of the year for the report.

09/05/91 : Equivalent Month/Day/Year of the report.

LINE 02
-------
10.7 FLUX=164.5 90-AVG=206 SSN=204 BKI=5454 3323 BAI=025

10.7 FLUX=164.5 : The 10.7 cm solar radio flux as reported by the
NRC-Dominion Radio Astrophysical Observatory (DRAO) in
Penticton, British Columbia, Canada (formerly produced
by the Algonquin Radio Observatory in Ottawa).
```

90-AVG=206 : This value represents the 90-day average 10.7 cm solar
radio flux.

SSN=204 : This value is the observed sunspot number as observed by
NOAA.

BKI=5454 3323 : These digits represent the 8 three-hourly Boulder K-indices
as observed by the Boulder USGS magnetometer. The first
digit represents the observed K-index for the period from
00:00 UT to 02:59 UT. The second digit represents the
observed K-index from 03:00 to 05:59 UT, and so forth.
If data is unavailable, it is replaced with an asterisk.

BAI=025 : This value is the observed 24:00 UT Boulder A-Index for
Boulder, Colorado.

LINE 03

BGND-XRAY=B8.6 FLU1=2.7E+05 FLU10=8.3E+03 PKI=5454 4333 PAI=029

BGND-XRAY=B8.6 : This is the background x-ray flux value as reported by the
Space Environment Laboratories. This value is produced by
observing the background x-ray emissions in the soft-xray
band (1 to 8 Angstroms). Consult the "Glossary of Solar
Terrestrial Terms" as produced by the STD for information
on understanding the x-ray classification scheme. This
document is available for anonymous FTP from the site:
"solar.stanford.edu" in "/pub", or on "nic.funet.fi".

FLU1=2.7E+05 : This value is the observed proton fluence at greater than
1 MeV (million electron volts).

FLU10=8.3E+03 : This is the observed proton fluence at greater than 10 MeV.

PKI=5454 4333 : These digits represent the 8 three-hourly estimated
planetary K-index values for the UT day. The format is
the same as is used for the Boulder K-indices noted above.

PAI=029 : This value represents the estimated planetary A-index value
for the UT day. Occassionally, this value is not available
at the time the data set is compiled. If this is the case,
a preliminary calculation is made to estimate the planetary
A-index value using the planetary K-indices. Although this
will not produce an officially accurate result, the results
calculated in this way are usually accurate to +/- 2 points.

LINE 04

BOU-DEV=093,051,073,060,023,030,012,021 DEV-AVG=045 NT SWF=05:079

BOU-DEV=093,051,073,060,023,030,012,021
These values represent the observed maximum deviation in
the Boulder USGS magnetometer. The values are in nano-
tesla (nT, or reported as "NT" elsewhere in the report).

The first value represents the observed maximum deviation
of the geomagnetic field (using the most disturbed magnetic
component) during the period 00:00 UT to 02:59 UT. In this
example, the maximum deviation observed was 93 nT between
00:00 UT and 02:59 UT. The second value represents the
maximum deviation between 03:00 UT and 05:59 UT. Each of
these values correspond to the observed Boulder K-index
as reported on line 2 of this daily report.

DEV-AVG=045 NT : This value represents the average daily maximum deviation
of the Boulder magnetometer, given in units of nanotesla
(or NT). It is produced by simply averaging the 8
three-hourly maximum deviation values given on this line.

SWF=05:79 : The first value (05) represents the number of possible
episodes of Short Wave Fades (SWFs) observed during the
UT day. Short wave fading is simply a period of time when
the absorption of High Frequency (HF) radio waves increases
which produces a decrease in signal strengths of HF signals
OVER SUNLIT AREAS. In other words, this value represents
the approximate maximum number of times HF signals may have
faded out during the UT day. It is important to note that
SWFs are the strongest over the low and middle latitudes
and are ONLY observed during the daylight hours, preferably
when the sun is higher in the sky.

The second value (79) represents the estimated maximum
number of minutes that solar-flare activity may have
produced observed SWFs. In this example, solar activity
may have produced observed SWFs as many as five times
during the UT day. The estimated maximum number of
minutes that signals may have been degraded was 79.

Please note that these values are estimated maximums.
It is important to remember that most regions of the world
are in darkness for many hours each UT day. During periods
of darkness, SWFs will not be observed. Therefore, these
values are most useful as indicators of the possible
ionospheric disturbances which may have occurred during
the daytime hours. Days with 00 episodes of SWF activity
denote low levels of daytime sporadic HF signal absorption.

LINE 05

XRAY-MAX= M4.4 @ 0111UT XRAY-MIN= B8.0 @ 0914UT XRAY-AVG= C2.5

XRAY-MAX= M4.4 @ 0111UT
This value represents the maximum observed X-ray level
during the UT day, as well as the time of its occurrence.
In this example, x-rays during this UT day peaked at a
class M4.4 level at 01:11 UT.

XRAY-MIN= B8.0 @0914UT
This section of the report represents the minimum observed
x-ray level during the UT day. Same format as the maximum.

XRAY-AVG= C2.5 : This value represents the average x-ray flux observed
during the UT day. This value is determined by averaging
all of the 1-minute x-ray values during the UT day. This
average value might not always be determined by a full set
of one-minute daily values. If data from the GOES
spacecraft supplying this information is temporarily
halted, this value will be calculated from those daily
one-minute values which are received. It is therefore
possible, (although extremely unlikely) that this average
value may be produced from only one or two one-minute flux
measurements.

It is important to distinguish the difference between the
background x-ray flux and the average x-ray flux. The
average x-ray flux is the actual numerical average of all
daily x-ray bursts (including all x-ray flares). The
background x-ray flux is the lowest stable x-ray level
observed during the day which is not associated with x-ray
bursts. The x-ray average will therefore almost always be
higher than the background x-ray flux. In this example,
the average x-ray flux is a fair bit higher than the
background level, possibly due to a number of x-ray bursts
which occurred during the UT day.

LINE 06

NEUTN-MAX= +003% @ 2250UT NEUTN-MIN= -002% @ 1700UT NEUTN-AVG= +0.5%

NEUTN-MAX= +003% @ 2250UT
This is the maximum observed neutron monitor count as
observed by the Thule neutron monitor. It indicates a
maximum observed value of 3% which occurred at 22:50 UT.
Significant maximums of greater than 10% may be related to
Ground Level Events (GLEs) which are associated with near-
relativistic particle bombardments from major solar flares.
These neutron monitor values are determined by examining
the 5-minute averages of the neutron monitor count rates.

NEUTN-MIN= -002% @ 1700 UT
This is the observed minimum neutron monitor count as
measured by the Thule neutron monitor. Values below
-5% may be related to Forbush decreases (FDs) which are
most often associated with strong geomagnetic disturbances.

NEUTN-AVG= +0.5%: This value represents the average neutron monitor count as
observed by the Thule neutron monitor. Average values
below -5.0% are associated with Forbush decreases.

LINE 07

PCA-MAX= +0.7DB @ 1425UT PCA-MIN= -0.2DB @ 2325UT PCA-AVG= -0.1DB

PCA-MAX= +0.7DB @ 1425UT
This section shows the maximum Polar Cap Absorption (PCA)
level observed during the UT day by the Thule T30A
Riometer. Positive values indicate elevated levels of
ionospheric absorption over the polar regions. As a
result, positive values (particularly in excess of about
1.0 to 2.0 dB) are sufficient to cause notable attenuation
of HF signals over or near the polar regions. Values
larger than 3.0 to 4.0 dB may cause heavy to complete
absorption of HF radio signals over the polar and possibly
some high latitude signal paths. Riometer values less than
or equal to 0.0 dB are associated with negligable
absorption levels over the polar regions. Note that small
levels of absorption (of only a few tenths of a dB) may be
sufficient to cause errors in navigational signals such as
OMEGA navigational signals traversing the polar regions.

PCA-MIN= -0.2DB @ 2325UT
This is the minimum PCA level observed during the UT day.

PCA-AVG= -0.1DB : This is the average PCA level observed during the UT day
and is calculated by averaging the 5-minute averaged
riometer measurements during the UT day.

LINE 08

BOUTF-MAX=55331NT @ 2250UT BOUTF-MIN=55263NT @ 1649UT BOUTF-AVG=55301NT

BOUTF-MAX=55331NT @ 2250UT
This is the maximum observed value of the Total magnetic
Field (TF). The total field value is calculated by using
all three orthogonal components of the geomagnetic field.
These values are valid for Boulder, Colorado. The field
values are in units of nanotesla (NT). The time of the
maximum is also indicated.

BOUTF-MIN=55263NT @ 1649UT
This is the minimum observed value of the total field at
Boulder, Colorado.

BOUTF-AVG=55301NT
This is the daily average of the total magnetic field
strength as observed at Boulder for the UT day.

LINES 09 & 10

GOES7-MAX=E:+113NT@ 0607UT GOES7-MIN=N:-052NT@ 0911UT G7-AVG=+067,+063,+002
GOES6-MAX=P:+101NT@ 1925UT GOES6-MIN=N:-010NT@ 1439UT G6-AVG=+073,+026,+014

These two lines report the maximum, minimum and observed
average values of the geomagnetic field at geosynchronous
altitudes as observed by the GOES-6 and GOES-7 spacecraft.
GOES-7 is the primary spacecraft and is therefore reported
first.

The first capital letter following the "GOES7-MAX="
statement indicates which component of the magnetic field
experienced the maximum value observed during the UT day.
There are three possible letters which may be used here,
representing one of the three possible magnetic components:
P = The component parallel to the Earths rotation
axis. Positive values are northward. Negative
values are southward.
E = This is the Earthward component. Positive
values represent a downwardly directed field
(ex. toward the Earth or Earthward).
N = This component is perpendicular to the other
two. Positive values represent a westwardly
directed field. Negative values are eastward.
The figure following the "P:", "E:", or "N:" is the
observed magnitude of that component, followed by the time
that the value was observed. In this example, the GOES-7
spacecraft Earthward magnetic component was the observed
maximum component during the UT day. The magnitude of this
maximum Earthward component was +113 nanoteslas. This
represents a downwardly directed magnetic field with a
strength of 113 nT. GOES-7 observed this max at 06:07 UT.

This same format is followed for the minimum values
observed on GOES-7 as well as for the values on GOES-6.

G7-AVG=+067,+063,+002
This line reports the average geomagnetic field strengths
for the three magnetic components of the GOES-7 spacecraft.
The first value will ALWAYS represent the Parallel magnetic
component. The second value will ALWAYS represent the
Earthward magnetic component. And the last value will
ALWAYS represent the Perpendicular component. So in this
example, the average daily magnetic field strength for the
parallel component was +67 nT. The Earthward component had
an average field strength value of +63 nT while the
perpendicular component had an average value of +2 nT.

This same format is followed for the average values of the
GOES-6 secondary spacecraft.

LINE 11

FLUXFCST=STD:160,157,155 ; SESC:160,155,150 BAI/PAI-FCST=15,10,10 / 15,15,18

FLUXFCST=STD:160,157,155 ; SESC:160,155,150
The first three values represent the 72-hour forecast
10.7 cm solar radio flux values as produced by the Solar
Terrestrial Dispatch (STD). The second group of three
values are the 72-hour 10.7 cm solar radio flux forecast
values as issued by the Space Environment Services Center.
If either of these two forecasts are unavailable, "N/A"
will be used in place of the digits.

BAI/PAI-FCST=15,10,10 / 15,15,18
The first group of three values represent the 72-hour
forecast Boulder A-Index (BAI) values as issued by the
Space Environment Services Center. The second group of
three digits represent the 72-hour forecast Planetary
A-Index values (PAI) as issued by the United States Air
Force (USAF) Global Weather Central.

LINE 12

KFCST=3344 5433 2334 4211 28DAY-AP=019,011 28DAY-KP=2333 4333 2233 2322

KFCST=3344 5433 2334 4211
These digits represent the 48-hour K-index fourcasts as
released by the Space Environment Services Center. The
first value represents the forecast K-index value for 00:00
to 02:59 UT. The second value represents the forecast K-
index value from 03:00 UT to 05:59 UT, etc. The sixteen
digits define the expected K-indices for the next 48 hours.

28DAY-AP=019,011: These values are the historical estimated planetary A-index
values that were observed 28 days ago (approximately one
solar rotation). The first value represents the observed
estimated planetary A-index value 28 days ago. The second
value represents the value observed 27 days ago. These
two values may help serve as a guide to the possible
intensity of recurrent geomagnetic phenomena.

28DAY-KP=2333 4333 2233 2322
These digits are the estimated planetary K-index values
that were observed 28 days ago. The first group of eight
digits (2333 4333) represent the three-hourly planetary
K-indices that were observed 28 days ago. The second
group of eight digits (2233 2322) represent the K-index
values that were observed 27 days ago.

LINE 13, 14...

WARNINGS=*MAJFLR;*PROTON
ALERTS=**MAJFLR:X1.1/2B,N20E29(6857),0523-0555-0641,II=2@0551,IV=3@0602;
MINFLR:M4.4@0111;MINFLR:M2.3@0528;**MINFLR:M1.6@1209;
**TENFLR:2200,DUR:N/A

These lines summarize the Warnings and Alerts which are active at
the end of the UT day. Each warning category is prepended with a SINGLE
asterisk. Each alert category is prepended with DOUBLE asterisks. The end
of each warning and alert is appended with a semicolon if more warnings
follow. If no warnings follow, a carriage return concludes the category.
Warnings and alerts may span several lines. These WARNINGS are valid:

*MAJFLR = Potential Major Flare Warning
*PROTON = Potential Satellite Proton Event Warning
*PROTFLR = Potential Proton Flare Warning
*GSTRM = Potential Geomagnetic Storm Warning
*MSTRM = Potential Minor Geomagnetic Storm
*JSTRM = Potential Major-Severe Geomagnetic Storm
*AURMIDWCH= Middle Latitude Auroral Activity WATCH
*AURMIDWRN= Middle Latitude Auroral Activity WARNING
*AURLOWWCH= Low Latitude Auroral Activity WATCH
*AURLOWWRN= Low Latitude Auroral Activity WARNING
*PCA = Potential Polar Cap Absorption Event Warning

The following ALERTS are valid:

**MAJFLR = Major Solar Flare Alert
**MINFLR = Minor Solar Flare Alert
**MINSTRM = Minor Geomagnetic Storm Alert
**MAJSTRM = Major Geomagnetic Storm Alert
**SVRSTRM = Severe Geomagnetic Storm Alert
**PCA = Polar Cap Absorption Event Alert
**PCAENH = Polar Cap Absorption Enhancement Alert
**PROTN10 = Satellite Proton Event Alert at > 10 MeV
**PROTN100= Satellite Proton Event Alert at > 100 MeV
**PROTNENH= Satellite Proton Enhancment Alert at > 10 MeV
**MAGSI = Magnetic Sudden Impulse Alert
**245STRM = 245 MHz Radio Noise Storm Alert
**TENFLR = Tenflare Alert
**SWEEP = Sweep Frequency Event Alert
**FORBUSH = Forbush Decrease Event Alert

Each of the alerts may be followed by a colon and very terse descriptive
text describing parameters of the event. For example, the alert section
within this example reads:

ALERTS=**MAJFLR:X1.1/2B,N20E29(6857),0523-0555-0641,II=2@0551,IV=3@0602;
MINFLR:M4.4@0111;MINFLR:M2.3@0528;**MINFLR:M1.6@1209;
**TENFLR:2200,DUR:N/A

This line consists of FIVE alerts (each set of double asterisks denotes the
start of a new alert): One major flare alert, three Minor Solar Flare alerts
and a Tenflare alert. In this example, the major flare was a class X1.1/2B
event located at N20E29 within Region 6857. It began at 05:23 UT, peaked at
05:55 UT and ended at 06:41 UT and was associated with a Type II sweep
(importance 2) at 05:51 UT and a Type IV sweep (importance 3) at 06:02 UT.
If a tenflare would have been associated with this event, it would have been
treated as a separate alert with a time corresponding to the time of the

major flare. In this ficticious example, no tenflare was observed.

The first minor solar flare was a class M4.4 which occurred at 01:11 UT. The second was a class M2.3 at 05:28 UT. The third was a class M1.6 at 12:09 UT and the Tenflare was observed at 22:00 UT. The DURation of the tenflare was unknown (not available) at the time the report was compiled.

Notice that the last alert is not followed by a semicolon. This marks the end of the alert section.

LAST LINE

!!END-DATA!! : The last line of the daily report will ALWAYS contain this final statement, which signifies the end of the data set.

FINAL NOTES

Additional warnings and alerts may be added to those mentioned here. The format of this data set may also change over time. Data may be added or deleted from the existing data set. However, for the most part, the structure will remain the same. Comments may be appended to the message following the dataset (ex. following the !!END-DATA!! marker), although this will not be a common practice. The length of the daily data set should be approximately 15-16 lines, but may vary slightly depending on the number of warnings and alerts that are active during each day.

This is the same data set that is sent to other organizations and institutions for research or professional purposes. Individuals or organizations with a need to directly receive this data through email should send requests for placement on the mailing list to: Oler@Hg.Uleth.CA, or to: COler@Solar.Stanford.Edu. Only those with a professional need, or those who receive the data too late to be of value, are encouraged to request direct access to the mailing list.

There may be infrequent days when no data sets are broadcast. This may be due to local computer problems, or perhaps possible problems with sites forwarding the data sets through the nets. In most circumstances, the data sets should arrive daily. They are usually released once a day, sometime after approximately 02:00 to 03:00 UT. This time lag into the new UT day is required so that all of the data associated with the previous UT day may be collected and processed for inclusion with the daily data set.

** End of Daily Solar Geophysical Broadcast Description **

2471. H.R. 1674, Technical reasons for owning a scanner needed.

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-08 01:23:14 UTC
From: whs70@taichi.uucp
Message-ID: <1991Sep8.012314.14011@porthos.cc.bellcore.com>
Source record: 293841

Today I had the opportunbity to personnally meet with two NJ congressman.
I briefly told them both about my being against section 8 of HR 1674.
They both expressed interest in hearing why an outright ban should not
be implemented. Now I need to document as many things I can and send
them both a written explanation. So, at least one individual previously
posted a list of excellent reasons why we should not ban any equipment
simply because it can receive cellular, etc. Unfortunately I don't
have a copy of that.

Could any of you that have input please email it to me ASAP so I can
get something to them quickly.

Note, if email to me bounces, try one or the other of the addresses
in my "sig" file below.

Thanks.

From: dube@cpdvax.CSc.ti.COM
Message-ID: <199109080136.AA14651@tilde.csc.ti.com>
Source record: 293840

Jeff Gold, AC4HF, mentioned a problem with the digital display on his 820. First check the output from the 5-volt regulator, "5V-AVR" board. This thing can lose regulation, causing all sorts of funny things to happen in the counter. By the way, Jeff, any idea why my 820 won't come on the first time the switch goes on?

>Subject: Re: vehicle radio grounding/fusing
>Message-ID: <1991Sep6.201635.2818@novell.com>

>1. To eliminate RFI, it is best to wire radios directly to battery.
> Most high quality radios have positive and negative leads, and the
> chassis of the radio is tied to the vehicle chassis.

It is always best to keep ground leads as short as possible. The longer
they are, the more susceptible to noise pickup they are. I'd connect
my ground lead to a solid metal ground as near the radio as I could, and
run the hot lead to the battery, with some bypassing at both the battery
and at the radio.

>2. The wiring scenario above can cause a problem when the ground strap
> between the battery and vehicle chassis snaps, a not so uncommon
> occurance.

I've been driving and owning automobiles since 1950, and I have yet to have
this happen. In fact, only once have I known anyone to have this happen; and
that was when the person let acid eat into the battery cables. I don't think
it is a very common occurrence.

> In this case, the radio becomes part of the return path
> for major current drawing devices such as the starter motor, and
> can lead to radio destruction, or worse, fire.

This is a grand reason for grounding as near the radio as possible, aside from
noise considerations.

2475. Re: R-390 Caution

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-08 03:43:19 UTC
From: chuck@eng.umd.edu
Message-ID: <1991Sep08.034319.11255@eng.umd.edu>
Source record: 293847

In article <5355@bnr-rsc.UUCP> mwandel@bnr-rsc.UUCP (Markus Wandel) writes:
>Is that the same glow-in-the-dark stuff as on old wrist watches and clocks,
>inside light switch handles, etc? The stuff that needs to be exposed to
>light to "charge" after which it glows for an hour or so, and gives off
>a greenish light? If that stuff is a well documented health risk, I have
>never heard of it. Or are we talking about different stuff here.

In the old days, the most common way of making a luminous paint was to mix 1 part of Radium with 1000 parts of Zinc Sulfide. This pigment, combined with varnish would make a paint that would glow dimly all night long. What happens is the Radium decomposes slowly to form alpha particles and Radon gas. The alpha particles excite the Zinc Sulfide to fluoresce and light is emitted. The problem with Radium is it also emits the more dangerous Gamma rays. What was done in more modern watches was to mix the Zinc Sulfide with substances that emit only alpha particles. One such substance that was used in LCD watches was Tritium. Since Tritium is a gas, it was placed in a small ampoule that was coated on the insides with Zinc Sulfide.

(Note, Alpha particles are relatively weak, and as such cannot pass thru glass, or even paper!)

Zinc Sulfide is a rather remarkable material, it makes a great white paint pigment. When a large quantity (eg thick) of Zinc Sulfide is exposed to bright light, it will glow for several minutes. Zinc Sulfide is one of the principal components of old CRT's screens. It and other flourescent materials are what generally shows up in cheap glow toys. It is harmless.

Radium Dials are also generally harmless. There are, however a few things that you should never do with them. One is to eat them (that should be obvious?), another is to live with them in close proximity to your genitles (that means don't wear them as wrist or pocket watches).

And here is a rule that is very important: Do NOT open their enclosures! opening the watch or meter with a Radium dial will first give you a wif of Radon gas, which isn't too terrible a problem, but mostly, it will expose you to any particles of the Radium that might have broken free from the paint. These particles may then get into your lungs, or onto your hands, or may live under your fingernails, and may get eaten. Once the Radium has been ingested, you will then be exposed to ALL of the particles emitted by the Radium for about 1500 years. That is a good way to get cancer.

One more thing, your exposure to the radioactive particles from a small source (such as a watch dial) falls off as the cube of the distance you are from the source. (eg. your exposure at 2 feet is 1/8th your exposure at 1 foot) The gamma radiation of a radium dial is about 1000 to 2000 counts per minute when your geiger tube is right on the dial, but it is virtually unmeasurable

with a geiger-mueller tube at 2 feet.

As to the "Well my R390 glows" "Well mine doesn't!" argument, you are both right. The R390 came both ways. The older ones don't glow, the newer ones do. I suspect, that the substance used in the R390 is NOT Radium. It is probably Tritium, (which was used in the Viet Nam era Army Watches). The Govt employee's that do the surplus screening are generally $4/hour flunkies that couldn't tell a risk from a reward. They remove meter dials, and then surplus toxic chemicals in the same day. (someone once told them about the radioactive Thorium in vacuum tube cathodes, and they started removing them, but that is another story)

Chuck Harris - WA3UQV

2476. What are some good ham transcievers?

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-08 03:44:35 UTC
From: rja@batcomfs.Eng.Sun.COM
Message-ID: <19671@exodus.Eng.Sun.COM>
Source record: 293846

I recently began my first foray into the world of radio with
the purchase of an R-1 reciever. I'm now reading Now You're
Talking to go for the amateur license I've long coveted, but
never gotten around to getting. Looking to the future, I'm
wondering what kind of base-station transcivers I should be
looking at.

I'm more interested in advice relating to some esoteric listening
interests than transmissions. Specifically I'm interested in
reception in the low MHz range, and maybe RTTY capability. I'd
like for the receive portion of whatever I buy to be digital
capable for future use. Ideally what I would buy would be
a transciever, but if I have to buy a receive-only box to
get the features that I want, that would be OK.

The Icom R-7000 seems nice, but I haven't examined it in detail;
I don't know if it's digital capable.

Pointers will be much appreciated. You can email me, and I'll
summarize to the group if that would be best.

2800 Meadowview Rd., Sacramento, CA 95832 (916)427-4281
RACESBUL.186 DATE: September 9, 1991
SUBJECT: PRESS - PUBLIC RELATIONS, Part 5/5
Tell the press officer you have a member of the press on
site, and relay the press request. Usually you can get a quick
"statement for use if asked" from the PIO on site.
Stay within the accepted and acknowledged guidelines for
what can and can't be said.
Now, tell the press exactly what it is you are doing to aid
the situation. Explain any interesting equipment or tactics.
Remember, what may be routine to you, such as using ATV, or
packet, or using a computer to send a Morse message, may peak the
interest of the reporter.
TV is another facet of this wonderful game. A few tips:
* Look directly at the reporter, not the lens of the camera.
* Be absolutely relaxed.
* Keep your answers very very short and to the point.
What I have attempted to give you is a very quick glimpse
into the care and feeding of press for our own public relations.
Every incident is unique, but the simple matter is that if
we feed and care for the press with "good stuff" before an
incident, then in an incident you can bet your bottom dollar that
the press won't forget you.
Summing it all up: If we have a story to tell -- outside of
the an ICS incident -- tell it as best you know how. Keep It
Simple Stupid (KISS) when dealing with the press.
If you need PR or press during an ICS incident, be sure you
go through proper channels. Let's not cross thread the brass
screw.

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

AMSAT-NA APPOINTS NEW OFFICERS

HR AMSAT NEWS SERVICE BULLETIN 250.01 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 7, 1991
TO ALL RADIO AMATEURS BT

AMSAT-NA President Doug Loughmiller (KO5I) Announces New Officer Selections

As everyone is aware a number of officers have recently resigned their positions
for a variety of reasons. In response to these resignations I am making the
following appointments to fill these key positions.

Bruce Rahn (WB9ANQ) has agreed to serve as interim Vice President of Operations
until a permanent replacement can be selected at the AMSAT Annual meeting in
November. Bruce has played a key role in the commanding of the Microsat satel-
lites and was recommended to fill the position by the former AMSAT Vice Pre-
sident of Operations, Courtney Duncan, (N5BF) who had worked closely with Bruce
on various operational issues. Bruce will continue to serve as lead Microsat
command station in addition to assuming his interim duties.

Filling the slot of Executive Vice President which was left open by the resign-
ation of Dr. John Champa (K0OCL) is Bill Tynan, W3XO. Bill needs no introduction as he is a
founding
member of the organization and has most recently served as the Vice President
Of Manned Space Operations for AMSAT. Bill has voiced an interest in serving in
this capacity and I am pleased that Bill has seen fit to volunteer his expertise
and energies to fulfilling this role. He indicates that he wishes to continue to
oversee the organizations Manned Space activities until a replacement can be
identified and brought up to speed in this area. K8OCL has indicated a desire
to change his focus of activities upon the more technical aspects of satellite
construction and indicates that he will continue to serve as a active volunteer
and board member.

Finally, I have appointed former Vice President of Field Operations Mike
Crisler (N4IFD) once again to this position replacing Dr. Jeff Wallach (N5ITU).
Jeff has been particularly busy with his professional work load leaving little
time for volunteer day to day activities of the Field Organization. While Jeff
is stepping down as the VP of Field Operations he has indicated that he wishes
to continue to participate in various AMSAT activities. N4IFD has recently
returned to the Field organization by contributing to a wide variety of activit-
```

ies including hamfest and convention support, most notably this year's Dayton Hamvention.

I wish to take this opportunity to thank Courtney, John and Jeff for all of their contributions to the AMSAT organization their participation has been greatly appreciated.

I know all of you will join me in welcoming Bruce, Bill and Mike into their new positions. We look forward to working with all of these capable gentlemen as they assume their new responsibilities.

/EX

AO-13 OPERATIONS UPDATE

HR AMSAT NEWS SERVICE BULLETIN 250.02 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 7, 1991
TO ALL RADIO AMATEURS BT

James Miller (G3RUH) Explains Current And Future AO-13 Operations

AO-13 SCHEDULE

91Aug15 to 91Sep18 ! 91Sep18 to 91Dec12
Attitude: 180/(12-0) ! 180/0

Mode-B : MA 000 to 095 ! MA 000 to MA 095
Mode-JL : N/A ! MA 095 to MA 125 Except Nov 17- Dec 25
Mode-LS : N/A ! MA 125 to MA 130 B Transponder OFF
Mode-S : N/A ! MA 130 to MA 140 MA 10-40
Mode-B : MA 095 to 256 ! MA 140 to MA 256
Omnis : MA 230 to 030 ! MA 230 to MA 030

ATTITUDE CHANGE NEWS

The planned re-orientation to Blat/Blon 180/20 was completed on Aug 15 and the transponder schedule changed to continuous mode-B.

At this attitude the sun angle (angle of the sun to the solar panels) was 31 degrees, resulting in an effective illumination of 100*Cos(31) = 86% of maximum. However with the satellite antennas pointing 20 degrees out of the orbit plane, the "squint" or "pointing" angles were very, very poor.

To improve this situation, the attitude latitude was steadily reduced, 2 degrees at a time, and is presently Blon/Blat 180/1, with an associated Sun angle of 39 degrees, or 78% illumination. The illumination is improving about 4% a week, so that on Sept 18 when the Sun angle falls below 30 degrees, Modes JL and S will be restored as previously announced.

ILLUMINATION INVESTIGATION

As the attitude latitude was lowered the Sun angle was implicitly worsened, ultimately reaching 43 degrees, or 73% illumination. This is the poorest value

at which we have ever operated AO-13.

However, tests via the Whole Orbit Data collection facility showed that the battery remained adequately charged (just) during the heaviest useage at a weekend.

The implication of this important trial is that during future attitude changes over the next two years our out-of-plane ALAT values can be restricted to about +10 degrees instead of the +25 degrees which had be feared.

This then will ensure continuous good service on mode-B at these times.

FEEDBACK WANTED

There has been much animated discussion recently on AO-13 about the utility of Mode-L. The feeling is essentially that "too much time is devoted to a transponder used too little by too few".

So be it. I (and Peter DB2OS and Graham VK5AGR, the other active command stations) would welcome constructive discussion about this. Suggestions as to alternative ways of structuring the schedule would be welcomed.

Remember in your "wild" deliberations the following constraints:

* Modes L and S are only useful when the squint angle is less than 20 degrees.

* Mode S transponder is only ON when mode-B is selected, and works FAR better if mode-B's passband is OFF (no transponder).

* Mode S beacon only when L is ON and J is OFF.

* Mode J can only be ON when mode L is ON

When all the feedback is in, say by Christmas 1991, we will be able to assess the suggestions, and see how best to reconfigure the flight software to accommodate them where possible.

If there is no feedback, then of course there can't be any changes made! Contact as below, or your local AMSAT representative and ask them to contact:

James G3RUH @ GB7DDX)
Peter DB2OS @ DK0MAV) or UO-14/FO-20
Graham VK5AGR @ VK5WI)

Information Source

Up to date details of operations from the AO-13 controllers, are ALWAYS available on OSCAR-13's PSK, RTTY and CW bulletins. RTTY is at 15-20 and 45-50 after each hour and CW is at 00-05 and 30-35 after each hour. Frequencies are 145.812 MHz and 435.656 MHz +/- doppler.

[ANS thanks James Miller (G3RUH) for the information for this bulletin]

SB ALL @ AMSAT $ANS-250.03
CURRENT AO-13 TRANSPONDER SCHED

HR AMSAT NEWS SERVICE BULLETIN 250.03 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 7, 1991
TO ALL RADIO AMATEURS BT

AO-13 Transponder Schedule / AO-10 Available for use

The AO-13 transponder schedule is as follows:

| 15AUG91 to 18SEP91 |
++++++++++++++++++++++++++++
Mode-B | MA 000 to MA 095 |
Mode-JL | N/A |
Mode-LS | N/A |
Mode-S | N/A |
Mode-B | MA 095 to 256 | Perigee eclipses, Min 9, typical
Omnis | MA 230 to MA 030 | 29, max 60 mins until end 1991

The spacecraft attitude has been calculated to be:

BLON/BLAT 180/1

The elimination of Modes JL, LS and S are due to poor pointing angles (squint angle) that will result with the reorientation to 180/0. This schedule will last only a month and beginning on 18-SEP-1991 AO-13 is scheduled to a return to an "All Modes" transponder schedule after another set of magnetorquing procedures is completed. This temporary cessation of UHF transponder operation presents an "opportunity" for all Mode J/L, LS and S operators to improve on your station without loosing any valuable operating time on the bird.

OSCAR-10 is currently available for Mode B operation when it is view of your QTH. PLEASE DO NOT attempt to use OSCAR-10 if you hear the beacon or the transponder signals FMing.

PACSAT NEWS

HR AMSAT NEWS SERVICE BULLETIN 250.04 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 7, 1991
TO ALL RADIO AMATEURS BT

AO-16 Experimenter's Day Schedule Announced

AO-16 Command Station Bruce Rahn, WB9ANQ, has announced the following PACSAT Experimenter's Day schedule for the remainder of September and first week of October:

DATE START TIME END TIME MODE

11 Sep 0210 UTC - 11 Sep 0320 UTC - 12 Sep RCO
18 Sep 0530 UTC - 18 Sep 0640 UTC - 19 Sep RCO
25 Sep 0530 UTC - 25 Sep 0500 UTC - 26 Sep RCO

02 Oct 2110 UTC - 01 Oct 2040 UTC - 02 Oct RCO

RCO: Raised Cosine Only

Operation of the S-Band transmitter with the raised cosine transmitter will resume in the fall.

While Experimenter's Day operations are scheduled to be conducted weekly, users are reminded that these operations may be shortened or canceled to allow uploading of improved spacecraft software. Watch for bulletins in the BBS and the telemetry text frame of AO-16 for changes to the schedule.

Users are requested to send reception reports and comments to WB9ANQ: @AO-16, @LO-19, @UO-14, or via CompuServe to 74017,2454.

2482. What is the Hz of my Body's electromagnetic emissions in the dark?

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-08 07:20:06 UTC
From: jcr@milton.u.washington.edu
Message-ID: <1991Sep8.072006.23189@milton.u.washington.edu>
Source record: 293852

Could someone please e-mail me what electromagnetic frequencies my body
is transmitting.

How many WATTs of light do I radiate in the dark?
gggg

I have carried my HT on my hip on flights throughout much of the US.
At most, they usually ask me to turn it on and make some noise with
it at the security gate. I usually just turn it on and open the squelch.

There are however, regulations about operating any kind of radio
while in flight. This includes receive as well as transmit.

>a pointer to a magazine article or other info source. I am looking for some
>thing to handle a 15 watt tube.

A straight inverter will handle this. 15 watt inverters are simple.

>Along the same lines, has anyone converted a PC power supply to 12 vdc?

This is fairly straight forward. The +12 can be used as is to power your
drives and RS232 ports. -12 can be made from +12 with a simple charge
pump, you don't need much. And if you need -5 at all you can regulate
it from -12 with a zener. The big problem is +5. You need lots of it
and it's inefficient to brute force regulate it down from +12 with a
pass regulator. A switching regulator can be used to do it with good
efficiency. It's easiest to simply use an inverter and leave the PC
supply alone, but you can modify the PC supply to operate off +12.
You have to replace the primary on the inductor with fewer turns of
heavier wire and use much heavier switching transistors.

>
>Only considerably more expensive radios include circuit that
>changes the CW offset *and sidetone* simultaneously. I don't
>think the IC-735 allows adjustment of its sidetone pitch;

This is correct. The IC735 uses a twin T oscillator Q51 to generate
the sidetone. R230, a pot accessable thru a hole in the bottom cover,
will allow you to vary the insertion level of the tone relative to
the received signal. It does not adjust the frequency of the oscillator.
A second control accessable thru the bottom cover will let you set
the tone of received audio, but this is just an ordinary "tone" control
like on your HIFI, it does not effect the frequency of the sidetone.

The sidetone is nominally 800 hertz which is the same as the CW filter
center frequency of the radio. You can "tweak" this by varying the values
of R227 and R228. It should be very close and you probably shouldn't
bother trying to substitute resistors to exactly hit the magic frequency.
Mine measures 803 hertz. That's certainly close enough.

>run the hot lead to the battery, with some bypassing at both the battery
>and at the radio.

Of course you want your *ground* connection as short and direct as possible
to the frame of the vehicle. However, *ground* and the *negative* return
lead are *not* necessarily the same thing. Many unibody cars have panel
to panel resistances as high as 2 ohms. This much resistance in a 12 volt
circuit is going to guarrantee modulation of the power system voltage,
not only by the varying current draw of the radio in transmit (SSB) or
receive (audio), but also every *other* electrical system on the vehicle,
such as the air conditioning fan, are going to *share* this resistive
path back to the negative post of the battery. *They* will modulate the
power being fed to your radio as well. By running a separate negative
lead to the battery, you avoid all this noise modulation getting into
your radio's power system. *Ground*, the *RF* return circuit, is the
connection you make from the *chassis* of the radio to the auto body.
This should *not* be the same connection that carries the DC negative
return current or you risk an RF feedback loop.

>>2. The wiring scenario above can cause a problem when the ground strap
>> between the battery and vehicle chassis snaps, a not so uncommon
>> occurance.
>
>I've been driving and owning automobiles since 1950, and I have yet to have
>this happen. In fact, only once have I known anyone to have this happen; and
>that was when the person let acid eat into the battery cables. I don't think
>it is a very common occurrence.

It is a quite common occurrence. Ask the electrical technician at your
dealership how many of these he has seen. Vibration often shakes loose
the hardware connecting this strap to the engine and corrosion often
makes this connection highly resistive. The straps rarely completely
open, but they don't have to to allow tens of amps of surge current

flow through your radio during starting.

>> In this case, the radio becomes part of the return path
>> for major current drawing devices such as the starter motor, and
>> can lead to radio destruction, or worse, fire.
>
>This is a grand reason for grounding as near the radio as possible, aside from
>noise considerations.

Because of the noise considerations it is recomended by *all* the major radio manufacturers that you *do not* depend on a body ground for your negative return circuit. They all recomend that you run both the positive and negative leads to the battery and that you fuse *both* leads near the battery.

Would you consider cutting one lead of the 110 VAC cords on your line powered equipment short and tieing it to your metal bench for the *ground* return for the power draw? After all the neutral is *grounded* at the power panel, what's the difference?

[Note for those who don't know better, DON'T TRY THIS AT HOME!]

]
]On the other hand, your neighbors could use the same argument to break
]the covenants against all kinds of things that *you* may not want in
]your neighborhood.

Yes, that's true. Perhaps if we had more diversity in CC&R's, then
there would be a CHOICE. I suspect lots of hams would be glad to give
up the right to dictate the color of their neighbor's house in order
to acquire the right to put up an antenna.

]>Opinion: Support ALL of the bill of rights, INCLUDING the 2nd amendment!
]
]Yeah, join the state militia.

The militia, as defined at the time of the Bill of Rights, included all
able bodied men (all right, they were sexist at the time). It was not
organized, and you did not have to join it. See talk.politics.guns for
detailes on constitutional history.

2488. Multi-mode data controllers

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-08 15:30:31 UTC
From: benchoff@groupw.cns.vt.edu
Message-ID: <2230@vtserf.cc.vt.edu>
Source record: 293861

I am considering purchase of an all-mode digital data controller
(PK-232, KAM, or MFJ-1278). I have been running 1200bps VHF packet
for a while with the Heath Pocket Packet TNC. I have also had a
chance to play with a PK-232 to try the other modes on HF. My main
interests are to be able to do some HF AMTOR and RTTY DXing, and some
9600 bps packet on VHF. I am having trouble deciding which box is
the best. Following is a summary of what I have determined so far.
Comments and corrections welcome.

My requirements:
* ASCII, BAUDOT, AMTOR 476 and 625, HF and VHF AX.25 packet, WEFAX, NAVTEX
* true DCD
* TCP/IP compatibility (KISS, PERSISTENCE, SLOTTIME)
* TNC 2 compatible
* external modem port
* supports external modem speed of 9600bps
* supports terminal speed of 9600bps
* tuning meter

Things that would be nice to have:
* multi-level grey for FAX
* SSTV
* automatic signal analysis mode
* modem using DSP (who else besides AEA?)
* programmable frequency shifts and tones
* dual ports that can be used at the same time

Current contenders (AES prices):
MFJ 1278 $259
Kantronics KAM $289
AEA PK-232 $319
AEA DSP-1232 $789

My questions:
- Do all of these meet my requirements?
- How many accessories have to be purchased to get operational?
- Are there other units I should be considering?

Thanks,
Phil

2489. Listing of longitude & latitudes of American cities?

>There is also the PIA factor: we don't want to all change our
>antennae to vertical, so, Mike, make yours horizontal when you
>get it back up.

Some hams who don't have the space (or should I say territory) for a large antenna farm may still want to do VHF/UHF DX-ing on multiple bands. The log-periodic antennas readily allow some activity across many such bands. I do know of at least one such antenna on the market that covers from 50 MHz to 1300 MHz. Granted it is not going to be the great performer that a long yagi on each band would be, but not everyone can do that, either.

The catch is that if you have ONE antenna, you have to decide what the polarization of that ONE antenna will be.

I say stay with horizontal on 222 MHz unless you can get everyone on all the VHF and UHF bands to all switch to vertical en masse. I doubt it.

Q: was the vertical idea thought up as a way to make use of the existing installed base of vertical yagis that are tunned to the upper 3 MHz of the band for FM repeaters?

There are some ear-mike and throat-mike gear advertised in the land mobile
trade rags, but other than Maxon. They don't advertise consistently so
you will probably have to still hunt around.

2492. Major Solar Flare Alert - X-class - 08 Sept.

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-08 18:21:11 UTC
From: oler@hg.uleth.CA
Message-ID: <0094E55E.FF94B780.9754@hg.uleth.ca>
Source record: 293860

/\

MAJOR SOLAR FLARE ALERT

ISSUED: 15:30 UT, 08 SEPT

/\

Low Impact Possible

MAJOR ENERGETIC EVENT SUMMARY:

Flare Size: Class X1.0/2N Location: S13W58 (Region 6818)
Tenflare: 390 sfu at 0907 UT Times: Begin=0905, Peak=0922, End=0929

Sweeps: Type II (Importance 2) at 0919 UT, Duration: 10 minutes
Type IV (Importance 1) at 0946 UT, Duration: 79 minutes

NOTES: A moderate to strong intensity SWF has been observed with this
event. The duration of the SWF was fairly brief, however.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT:

There is a slight risk for a terrestrial impact from this flare event.
Nothing significant is expected. If an impact does materialize, it is
expected to be low in intensity.

Region 6818 is capable of continuing its energetic flare production.
Further major flares are possible from this region.

There is a geographical name server available by telnetting to:

martini.eecs.umich.edu 3000 (IP number 141.212.100.9)

The "3000" refers to the 3000 socket it is on. How you tell telnet
about the socket is sytem-dependent, but a string like:

telnet <host> <socket#>

usually works.

The name server offers the ability to look up geographical names
providing information about population, longitude and lattitude, state
and country, etc.

There is also some fancy extension to ow the viewing of maps via
X-windows, but I haven't been able to confirm this feature. Anybody?

Flaky TS-820S display?

I recall this problem being discussed in QST several years ago.
The problem was caused by a poor ground connection on the display
board. The cure was to use a star-type lockwasher on the
foil side of the board over the screws holding the board.

POTENTIAL FOR LOW LATITUDE HF DEGRADATION: MODERATE
EXPECTED HF PROPAGATION CONDITIONS: GOOD - FAIR on 10 Sept.

POTENTIAL FOR MIDDLE LATITUDE HF DEGRADATION: HIGH
EXPECTED HF PROPAGATION CONDITIONS: FAIR - POOR on 10 Sept.

POTENTIAL FOR HIGH LATITUDE HF DEGRADATION: HIGH
EXPECTED HF PROPAGATION CONDITIONS: POOR - VERY POOR on 10 Sept.

SOURCE OF EXPECTED ACTIVITY: Well placed coronal hole,
Disappearing Solar Filaments,
Major Solar Flares.

** End of Warning **

2500. MIDDLE LATITUDE AURORAL ACTIVITY WARNING - 09 SEPT.

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-09 04:10:21 UTC
From: oler@hg.uleth.CA
Message-ID: <0094E5B1.4D3D1D40.10396@hg.uleth.ca>
Source record: 293874

/\

MIDDLE LATITUDE AURORAL ACTIVITY WARNING

ISSUED: 03:00 UT, 09 SEPTEMBER

/\

HIGH RISK PERIOD: 10 - 12 September
MODERATE RISK PERIOD: 10 - 13 September

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: MODERATE - HIGH

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: 47 - 55 North Latitude

POTENTIAL LUNAR INTERFERENCE: LOW

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: VERY GOOD

There is a good opportunity for middle latitude observations of auroral activity on 10 - 11 September. The combined effects of a well placed coronal hole, several solar filament disappearances, as well as possible effects from recent major solar flares should produce at least a moderately energetic auroral activity. Expansion and equatorward migration of the auroral oval will occur with this activity. The estimated equatorward boundary of the auroral oval for northern hemisphere observers is between 47-55 degrees north latitude. There is also a moderate probability for auroral observations from Australian and New Zealand regions (particularly on the southward sides of these regions). Lunar phase will not be a factor, so observations from dark-sky sites could yield positive results.

** End of Warning **

2501. LOW LATITUDE AURORAL ACTIVITY WATCH - 09 SEPT.

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-09 04:26:37 UTC
From: oler@hg.uleth.CA
Message-ID: <0094E5B3.92C57D60.10546@hg.uleth.ca>
Source record: 293865

/\

LOW LATITUDE AURORAL ACTIVITY WATCH

ISSUED: 03:00 UT, 09 SEPTEMBER

/\

MODERATE RISK PERIOD: 10 - 13 September

POTENTIAL MAGNITUDE OF LOW LATITUDE AURORAL ACTIVITY: MODERATE

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: 47 - 55 North Latitude

POTENTIAL LUNAR INTERFERENCE: LOW

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM LOW LATITUDES: FAIR

The probability for energetic auroral activity over the high and middle latitudes is sufficient to warrant a Low Latitude Auroral Activity WATCH. This watch is in effect from 18:00 UT on 09 September to 24:00 UT on 12 September. Conditions may become favorable for isolated auroral activity observations from low latitude sites (ex. equatorward of 40 N latitude). Lunar interference will be low, which should provide optimum conditions for observing auroral activity from dark-sky sites at low latitudes. The UT days of 10 - 11 September are expected to be the most energetic days although a moderate risk will continue through to 13 September.

** End of Watch **

For all of you serious contesters who failed to nail ZL in last
year's CQWW SSB contest: your troubles are over.

The Kiwi Contest gang will be putting ZM2K on the air in a
multi band multi operator effort.

A better site, much improved antennae and shorter feeder runs should
ensure not-to-be ignored signals.

Looking forward to good condx, see you on October 26, 27.

***** 50 cent buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS

FLEA all SUMMER at MIT
Sunday, September 15th, 1991
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 400 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $1.50 (you get 50c off if
you're lucky enough to have a copy of our add)
and sellers spaces are $8.00-each at the gate
or $5.00 if mailed by the preceding 5th. A sellers
Season Pass for all 7 sundays is available for $28
if purchased by April 21st

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

!! RAIN or SHINE !! Have no fear of rain, a covered
tailgate area is available for all sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

My TS820 has the same problem. Someone sent me a Kenwood Tech Note that addressed the problem. The solution involved cleaning contacts with some recommended chemical and making sure that socket clips were tight in the connectors joining the various modules involved with the digital display. Unfortunately, in recopying the tech note, I threw it all away and have been unable to procur another copy. You might look for it, and if you find it (or if anyone else has it) I would love to get another copy of it.

2511. AMSAT Nets

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-09 12:30:09 UTC
From: George_Muzyka@kcbbs.gen.nz
Message-ID: <1991Sep9.123009.3781@kcbbs.gen.nz>
Source record: 293855

I use to listen, here in New Zealand, to some AMSAT nets on HF frequencies, AMSAT-VK and AMSAT-UK, but haven't heard either lately (propagation and heavy traffic would be the likely reasons).

Here's a list of what AMSAT nets I know about, and I would very much appreciate any additions or corrections. Thanks.

AMSAT NETS ON HF FREQUNCIES:

MONDAY 1900Z AMSAT-UK Net 3780 kHz +/- QRM
WEDNESDAY 1900Z AMSAT-UK Net 3780 kHz +/- QRM
SATURDAY 1000Z European AMSAT Net 14280 kHz +/- QRM
SATURDAY 1100Z Sputnik Net 14270/14295 kHz
SUNDAY 0900Z AMSAT South Africa Net 14280 kHz
SUNDAY 1000Z AMSAT Australia Net 7064 kHz
SUNDAY 1900Z AMSAT International 14282 kHz
SUNDAY 2300Z ? AMSAT Net 18155 kHz

Note: Times not given in North American UTC times. :-)

What is the ``Sputnik Net'', by the way?

When I use to hear G3IOR hosting the European AMSAT Net it was always very weak and it was skillful listening to make out the words, although it was mostly G3IOR's good, professional vocal style that helped. VK5AGR's voice differs by being cool and relaxed, which unfortunately gets stomped out by the high amount of 42 metre traffic (shortwave broadcasters and heavy VK and ZL ham traffic).

Any extra info. would be most appreciated.

Regards, and 73s.

George Y. Muzyka

From: MROWEN%STLAWU.BITNET@cunyvm.cuny.edu
Message-ID: <9109091250.AA04016@ucsd.edu>
Source record: 293730

A couple of responses to recent postings:

Reduced intereference from nearby FM transmissions is indeed an advantage of horizontal polarization. It's my opinion, however, that we'll all gain more QSOs by being vertically polarized than we'll lose to interference. It's a trade-off, sure.

As for the PIA factor, well, that doesn't wash with me. If we just wanted to avoid hassle, we'd probably be on FM instead of SSB/CW. controlled AM.

>Two routes as I see it. 1) The swap meet scrounge - look for cheap used
>equipment. 2) Maximize your knowledge flow while minimizing your cash
>flow - junk box construction.

I attended a hamfest last Saturday. Here are some of the low-cost
possibilities I saw:
* Swan 350 with power supply: asking $120. Don't remember if a
mike was included.
(I use a 350 as the main rig in my shack. SSW/CW on 80, 40, 20,
15, and 10 meters, about 200 watts DC; nice old rig.)
* Swan 350C with power supply plus digital readout and something
else "unusual": asking either $175 or $275 (I don't remember)
and had NOT sold it by the time I left.
* TWO Kantronics 30-meter QRP rigs: asking $40 each, including a
microphone (!not legal on 30 meters!), don't remember if it also
included a key. About 20 watts. Needed external 13.8 volts
power supply (or car battery).

Last (1990) summer someone GAVE our local "middle school" radio club an
EICO 720 CW transmitter with send/receive relay and a Hammarlund
receiver. Transmitter was in fine shape (6146 final, about 60 watts),
but cost about $50 to get the receiver up to specs. (There was an AM
modulator for the EICO at the above-mentioned hamfest, but the "seller"
wouldn't go below $20, so I didn't even try to get it for the club!)

In 1970 I bought NINETEEN brand-new TCS-13 war surplus (literally)
transceivers (1.5-12 MHz, two 1625's [12-volt version of the 807] in
the final stage, with two MORE 1625's for AM modulation!) for $12.51
EACH from the Dept. of Defense. Power supplies were NOT included, but
keys, mikes, antenna tuners, and spare parts were. A few years ago I
bought another at a nearby hamfest for six bucks. I sold most of the
original 19, but one still sits on my operating desk and the other
waits as a spare; both are heavily modified (mostly I removed the AM
modulator on one and changed the link-tuning on both to PI outputs, but
withOUT modifying their outside appearance. Power supply is home-
brewed, and I also acquired a set of dynamotors for the ultimate in
mobile operation! (Whiiiiiiinnnnnnneeeeeeee!)

>>I guess most stuff
>> would be homemade, and the receiver would be an antique.

Last Xmas I built a 6L6 special transmitter: one tube (plus three more in the power supply!), about 10 watts out on 80 meters. Total junk box design, on wooden "breadboard". Best DX so far is Saskatchewan from Kansas. This coming XMAS I'm hoping to build the matching receiver, probably a two-tube regenerator with a few-tube audio section.

>No problem, there's a club that has contests with antique equipment.
>You get bonus points for running gear older than certain dates.

My entire station (described so far) qualifies!

The last issue of the "Ham Trader Yellow Sheets" carried SEVERAL advertisements for TenTec Triton IV's (also known as the Model 540), a "modern" (circa 1975?) solid-state 80-40-20-15-10 meter SSB/CW 100-watt transceiver with AC power supply for around $300. I also have one of these on my operating desk, with a converter which also covers 160 meters. Although I have the AC power supply, I also run my on a trickle-charged car battery which sits on a shelfe underneath my desk.

>> How does one check out a homemade transmitter, without access to $100K
>> worth of testing equipment?....

Attach it to a dummy load (usually a common light bulb of about the expected power output, and key it up! Listen to your transmitter on your receiver (assuming they are separate), or ask a nearby ham to listen to you. With the older, smaller transmitters, there isn't much that CAN go wrong!

>> What if you
>> accidentally spill off the edge of the legal band, because your frequency
>> scale is out of calibration? Do they send the goon squad after you?

>Yes, they will. In the old days, they used crystal calibrators....

Don't try to "squeeze" the band edges.
LISTEN to your transmitter on your receiver.
I bought a one-tube crystal calibrator for the middle school's Hammarlund at Saturday's hamfest; paid $2.00.

It is relatively easy to get on the air with less cost than a one-soda-pop-per-day drinker spends per year. And one year of a one-pack-per-day smoker's expenditures will buy really nice rigs!

Probably almost none. Unless, maybe, you once worked in a factory
painting watch dials with radium!

But it is relatively easy to calculate your total energy expenditure:
* How many "large" (kilo-) calories do you consume each day?
(Maybe 2500?)
* Convert large calories to watts: 1 large calorie = 3.968 BTU,
so 2500 calories in 24 hours = 413 BTU/hour = 121 watts/hour
(if I haven't made any mistakes).

I have been following the battery discussion with much interest. From the discussion, it seems that the best use of gelcells is as a trickle charged backup power system rather than trying to use them as primary power for any length of time (and especially if used indoors). I have been interested in operating battery powered over a period of time or an event (like Field Day or a camping trip) in order to avoid the use of a noisy generator and it seems that some other battery type (such as marine/RV deep cycle?) is more appropriate for this. Any comments or experience?

From: jkeller@pica.army.mil
Message-ID: <9109091336.aa27196@COR2.PICA.ARMY.MIL>
Source record: 293740

Does anyone have hands-on experience or familiarity with any of the "automatic CW decoder" units currently on the market? I've seen one in operation....the "Air-1" which works with a VIC-20 keyboard....it seemed to work pretty well in the "demo" mode at the hamfest, but that's pretty sterile. Before I shell out $100 it would be helpful to hear from someone who owns or has used one....or a similar unit....on-the-air.

The "Air-1" connects across phone or spkr leads for RX and direct to key input for TX. It has a send buffer of about 2400 characters, variable send speeds, memories, etc....and they claim it copies up to about 70 wpm.

Realizing such a unit would have it's limitations:

.....in actual use, do you leave it "on-line", and simply tune for a CW signal until it starts reading out on the screen?

.....should I expect trouble with copying anything but the strongest of signals? (i.e., will it handle any amount of QRM, QRN, fading, etc?)

.....how sensitive is it to "fist quality"?

.....will it kiss me good-night?

ANY information will be gratefully received.....(thanks in advance!!)

>
>On the other hand, your neighbors could use the same argument to break
>the covenants against all kinds of things that *you* may not want in
>your neighborhood.
>

I'm with Jon on this one. I signed the stupid CC+Rs (prohibits
any kind of antenna whatsoever, including cordless phones) when I
bought my house. Then, I waited until most of my neighbors moved in.
I then went and talked to them, explaing that I was a radio amateur
and wanted to erect some antennas. I also asked them to let me know
quickly of any TVI/RFI. I also pointed out the CC+Rs prohibited any
kind of antennas and that they could ask me not to erect them.

No one refused permission. Several folks were interested in learning
more aboutg radio. One guy is a CBer who is especially interested. I've
had nop TVI/RFI complaints, and no neighbor complaints. The CC+Rs we
signed were to insure that the development company could sell all the
homes; the CC+Rs even have a clause that invalidates itself once all
the homes sell.

My friend says his septic tank does the same thing. Maybe it's radioactive, too. Seriously, they were pulling your leg. The snow might melt where the plant used to be, but it isn't due to leftover radium. Decaying radium releases heat, but you'd need a whole lot of it to melt snow. More likely, (assuming that the snow really does melt) it's due to things rotting underground.

Not really amateur radio, though.

Only considerably more expensive radios include circuit that
changes the CW offset *and sidetone* simultaneously. I don't
think the IC-735 allows adjustment of its sidetone pitch;
...stuff deleted...

Have fun, and 73.

David Newkirk, WJ1Z

(blush) I goofed. (more blushing) I was sure that I read that
my rig had the pitch control but upon going back to the manuals
to see exactly how it worked, I was unable to find the reference
that I was sure I had read just two months before.

I attempted to post that discovery to the net but an unknown
error bounced the post and I never got around to re-posting it.

For the record: The Icom IC735 has a CW sidetone loudness control
but no sidetone pitch control. The sidetone frequency is fixed
at approximatly 900 Hz. While neither the user manual nor the
service manual specifically say so, the implication is that the
same frequency is used for the CW offset.

Sorry for any confusion that I may have caused.

Thanks very much Dave for setting the record straight.

^ ^
^Inter-character spacing Inter-word spacing^

See any ARRL Handbook. WPM = dots-per-minute / 25, where a "dots per
minute" is what you get if you hold down the dot lever on your keyer
(includes the dot plus the inter-dot space).

This should probably go into the FAQ file.

One reason to use PARIS is that for text word counting purposes the average word is usually taken to be five characters long. I don't know if anyone has any solid numbers that would show PARIS has any more statistically average distribution of dit's and dah's than any other five character word having the same timing.

For some reason, continuous strings of characters, as in transmitted and copied code groups, are very often divided into groups of five as well. A Human Factors engineering course I once took suggested uses of groups of "items" in fives (when no more obvious or better method of organization presented itself).

And of course, hams always copy five-by :-)

Cheers!

>receive (audio), but also every *other* electrical system on the vehicle,

Gary makes some good points. However, running a separate ground lead to the
battery is the EASY way, but not necessarily the BEST way. A compleat inst-
allation would comprehend all the following:

(1) Engine electrically connected to the chassis via heavy braid.
(2) Hood electrically connected to the body or frame via braid.
(3) Trunk lid electrically connected to body or frame via braid.
(4) Axles electrically connected to the frame. (For FWD vehicles,
the connection should be both inboard and outboard of the CV joints).
(5) Wheels electrically connected to the axles.
(6) All doors electrically connected to body.
(7) Body electrically connected to the frame (at several points).

Using braid, such as coax shielding, works best. Certainly, this is
NOT an easy undertaking. It takes 30 minutes or less to run a #10
wire from the radio ground to the battery ground; which is why I suspect
that radio manufacturers recommend it (and, to address the original
point, I'd fuse this line IF I were ever to use it, for the very reasons
cited).

>>>2. The wiring scenario above can cause a problem when the ground strap

>
>It is a quite common occurrence. Ask the electrical technician at your
>dealership how many of these he has seen.

This is the only point I can't agree with. I'll abide by my own experiences. When you get slow cranking with what should be a good battery, you should immediately look at these connections. A .05-ohm resistive connection will show up quickly with the heavy cranking current draw (60 amps x .05 gives a 3-volt drop in addition to normal circuit drops), but may not affect the radio.

>Would you consider cutting one lead of the 110 VAC cords on your line
>powered equipment short and tieing it to your metal bench for the *ground*
>return for the power draw? After all the neutral is *grounded* at the
>power panel, what's the difference?

This is rather far-fetched, but, for the sake of argument: Assuming that this lead would ALWAYS be the neutral (grounded) lead, I'd have no qualms about it, because I'd make sure all the connections were adequate electrically. In this case, also, it is EASIER to use existing wiring.... But a solid metal workbench might just offer less resistance than the #12 or #14 wire usually found in these installations. To be "further-fetched", let's connect the workbench to a metal building which I might use for my shack. With proper electrical connections between the aluminum sheets, and between the workbench and shack, I'd have a "real shield". :)

^^^^^^^^^^

>>(if I haven't made any mistakes).

You have, Myron, you have....

>>Myron A. Calhoun, PhD EE; Associate Professor

Hmmm, 'nuff said :-)

One way of doing it is to assume the human body is a black body at
300K ("assume a spherical horse"...) and estimate the area, giving
the luminosity. I asked this on a test once and my vague memory
is that it's closer to 1KW, but the calculation is left as an
exercise for the student - or Associate Perfessa :-)

Oh well, OK: assume human is 2m x 0.7m (x2 for front and back), and
at T = 300K. Since I can't remember Stefan-Botzperson constant,
scale to sun, R = 7E5 kms, T = 6000K, L = 4E33 erg/s, gives 1.25 KW.
So we are perhaps radiating at about the limit for amateurs anyway...

The peak of human radiation would come at about 10 microns, with
the same assumptions.

What was the question?

Jim, WA6SDM writes:

>Does anyone have info on making flourescent lights work on 12
>vdc? Perhaps a pointer to a magazine article or other info
>source. I am looking for something to handle a 15 watt tube.

A convenient source for 12 volt powered flourescent lights can be found at a place specializing in lamps for boats. Most small private yachts use 12 VDC power sources. My boat has two different types of lamp--one contains a single 7.5 Watt tube, another larger unit contains two tubes. Inside the lamp is a small circuit board which contains a blocking oscillator, which switches and transforms the 12VDC to about 200 VAC for the flourescent tube. These lamps are quite efficient, since they use relatively high-frequency AC (I think mine oscillate in the upper part of the AM broadcast band).

I got involved with these lamps because they generate copious amounts of interference on my Loran-C receiver (100 KHz), and just about any other receiver up to about 30 MHz. I was able to significantly reduce the interference by soldering a small solid tantalum capacitor (computer mother boards are full of these) of about 10 microfarads across the 12 Volt terminals at the oscillator board. This made the oscillator signal much more pure, and consequently it had less bandwidth.

If these are unavailable where you live, try a large mail-order boating supplier like Westmarine.

Good luck and 73,

Tom Serkowski asks for help in developing a device for Glider
flight recording.

Just a suggestion....Have you considered using Loran-C instead of
GPS? Loran-C is in widespread use in both aircraft and ships
(even small boats like my 30 foot motor-sailer).

Advantage: 1. Loran-C receivers are available in the $300
range.
2. Many of these have a standardized interface
(I believe it's the NMEA standard, whatever that is)
that allow the receiver to feed other devices.
3. Loran-C acquisition time is usually shorter than
GPS, which has to wait for satellites to fly over.

Drawbacks: 1. No altitude display is available--position
readout is only Loran T-D's or T-D's converted inside
the receiver to Lat/Long.
2. You'd need to get time information from a local
clock.
3. Loran-C interface may not be RS-232.

Good luck and keep flying!

On certain airlines, they do not allow electronic devices of any
kind to be carried or turned on while on the airplane. On one such trip,
I had a simple handheld scanner with me. They asked me to remove the battery
pack from the scanner and put it away.

It has never hurt anything which I have carried to be x-rayed. That includes
the HT, a portable dictating unit and tapes, floppy disks, an IBM convertable,
and a camera & 35 mm film. (I usually ask that the camera and film be hanc
checked, but have forgotten and let it be x-rayed.)

I have heard reports of disketts and film being damaged, but at least one roll
of unexposed film was x-rayed 3 times, and one set of floppies went through
5 or 6 times, and all were OK afterward.

Source record: 293759

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space and rec.radio.amateur.misc. This week's elements are provided below.

2544. Minor Geomagnetic Storm Alert - 10 September

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-10 04:13:14 UTC
From: oler@hg.uleth.CA
Message-ID: <0094E67A.DECAAC40.12723@hg.uleth.ca>
Source record: 293762

/\

GEOMAGNETIC STORM ALERT

ISSUED: 03:50 UT, 10 SEPTEMBER

/\

ATTENTION:

A minor geomagnetic storm has begun. Geomagnetic activity surpassed the minor storm event threshold near 03:00 UT on 10 September. Storming began increasing in intensity after approximately 02:00 UT. Conditions are expected to continue to intensify, particularly over the high latitude regions. Major to severe storming is expected there. Middle latitudes should witness mostly minor to periods of major storming. Activity should peak later this UT day or during the UT day of 11 September.

Conditions should begin to abate on 12 September.

** End of Alert **

2545. Re: Morse code timing (was: morse code for suns)

>five character word having the same timing.

I have seen this word pop up over the years as the WPM benchmark,
however I haven't seen anything official about it, either.

On the other hand, Communications Canada tells their designated
examiners (Canadian equivelent of the FCC's VE (sic)) that "PARIS"
sent 12 (or 5) times in 60 seconds is the calibration benchmark
for us to use when making our Morse examination tapes.

2546. GAP Antennas: Fact or Fiction

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-10 05:33:48 UTC
From: lyndon@cs.athabascau.ca
Message-ID: <1894@aupair.cs.athabascau.ca>
Source record: 293766

I'm interested in contacting anyone who has direct experience with the GAP antenna - specifically the new model that covers 80-10m as well as 6m and 2m. What I would like to know is: does this thing work? and if so, why?

I had a chance to play around with the 5 band version (80-10m) today. The documentation was sparse at best. There was no mention of how to tune the antenna, despite the fact that you *have* to tune it to your favorite segment of 80m. I also found that their "factory tuned - no adjustments required" setup had the antenna resonant at around 6900 KHz on 40m, and the antenna only provided full band coverage on 20m. They claim full band coverage everywhere except 80m. (Yes, the antenna had the counterpoise wires attached.)

So, was I test driving a dud? Or is this thing just braindead from the start? Has anyone seen anything approaching a halfways competent technical review of this product? Any ideas as to the theory behind its operation?

Reply to W9YH drew kb9fko@uiuc.edu Message Dated 10 Sept.

I am the President of the Amateur Radio Club of Queens College, CUNY
We have a fairly active membership of licensed operators, and are hoping to
increase our non-licensed base with the goal of making them "No-Kodes".
Our club could greatly benefit in joining any sort of net, whether it
be a Bit-net (haha) or 15 meters, take your pick. Our main problem right
now is to attract people into the hobby, encouraging them to upgrade and
get them on the air often. If there are any other people who would also be
interested in forming some kind of net, let Drew know.

> suitcase? What rules/security measures apply

New Zealand follows IATA rules, so you should be the same.

Unless the particular airline has its own restriction, there's
nothing to stop you taking it as hand-luggage. You can even
listen (using headphones) after takeoff and prior to descent when
the seatbelt sign is off. I've been aked to remove my (CD-player)
headphones during takeoff. Presumably they don't want you rocking
to the rhythm, or listening to a qso, when they're giving crash
instructions.

Yes. Transmitting is out. As a side-note. Our Minister of Police
was recently fined for answering his cellular telephone while on
an internal flight. A bit of a publicity gimmick, to show that he
was "not above the law". Given the current popularity of politicins,
I think most New Zealanders would prefer he'd been kicked off ... :-)

>
>Really folks, does anyone have any hard data about the harm this level of
>radioactivity can cause?

None. Don't worry about it. The radium dial is a fixed alpha emitter. What
that means in laymans terms is that IF you break the glass over the meter
AND stick you eye right next to the meter you may receive some radiation
damage to the retina of you eye. (But probably more from the glass
shards :-)) The real problem with radium dials is the possibility of
ingesting the stuff. If you scrape the radium paint off the dial and eat
it you would face a small and perhaps, but perhaps not, statistically
measurable increase in risk of developing lukemia or bone cancer. If you
don't ingest the stuff you are in absolutly no danger whatsoever.

2550. R-390 Caution

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-10 12:03:12 UTC
From: TSDIMO%GOR1@leav-emh.army.mil
Message-ID: <9109101204.AA06945@ucsd.edu>
Source record: 293770

Transmission Systems Dept, 791-4409
The TM for the AN/GRC-26D Radio Set indicates that two audio level meters contained Ra226. One with 0.69uCi and the other with 0.40uCi. Several other components have radioactive tubes, depending on the version of the radio set. I quote from the TM:
"The compoonents are potentially hazardous when broken. See qualified medical personnel and the local Radiological Protection Officer immediately, if you are exposed to or cut by broken components."
NEVER place radioactive components in your pocket.
Use extreme care NOT to break radioactive components while handling them.
NEVER remove radioactive components from cartons until you are ready to use them.
This radio set is/was mounted on a 2 1/2 ton truck, and had plenty of room for two operators. I spent a lot of time in the shelter for several years back in the sixties. Handle the meters and tubes with common sense and you will have no problem. By the way, the meters were easy to see in the dark, so long as your eyes were adapted to the dark (night vision).

2551. 222 MHz: vertical vs. horizontal

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-10 12:25:14 UTC
From: MROWEN%STLAWU.BITNET@cunyvm.cuny.edu
Message-ID: <9109101230.AA08061@ucsd.edu>
Source record: 293771

Phil -

The vertical idea wasn't thought up to make use of any surplus
FM antennas - it was proposed to make fuller use of the 222-225
MHz band. That's all. In the past, SSB/CW types could hardly
communicate with FM/repeater types. Now that we're all going
to share a 3-MHz slice of spectrum, I thought that it might
make sense for us to be able to talk to each other.
Since there are far more FMers than SSB/CW ops, it seemd logical to
propose that we SSB/CW people do the changing to vertical polarization.

I have always carried my scanner and HT on airliners as I've gone from here to there. You should not have any problem carrying eletronic items in carry-on luggage. Here's an example of what I mean by 'not have any problem':

I was set to travel to Norway during the height of the Iraq war. I decided that I was going to carry several pieces of electronics even though the airport restrictions were reported to be extremly tight. The night before I left I packed the following into my briefcase (for carry-on): Game-Boy, CD player, Sony ICF7600DS, BC 200XLT, Yaesu FT-470, and batteries for ALL the items. I had the following X-Rayed 4 times domestic and 2 times international and was only asked to open the briefcase once; that's right ONLY OPENED (didn't have to remove a thing), just once!

This experience is quite indicative of my experiences travelling. So, take whatever you want and have a good time!

Another convenient source for 12 volt powered flourescent lights can
be found at a place specializing in travel trailers or other RV's.

I paid about $20 for the one I have in my camper - works great.
If your time is worth anything at all you'll probably find it's
better to buy than to make.

>
>John Dobbs

Gell cells are about the best batteries to use indoors because they don't outgas or spill like traditional liquid electrolyte lead acid batteries. The main problem with them is that they aren't usually made in deep cycle designs. There are exceptions. Camcorder batteries and cell phone batteries are often gell cells and *are* of deep cycle design. If you treat them nicely and don't rapid charge them and don't discharge them too rapidly, they last a long time and supply nearly their full amp-hour rating of power.

If you need a lot of amps and you can locate your batteries outside, then the marine deep cycle batteries are the way to go. They're much cheaper per amp hour than gell cells and only require a bit of care to keep the electrolyte levels constant. I have a bank of eight 90 amp hour batteries here as backup power.

If you really want stationary plant power levels and very long battery life, then you should consider Edison cells. They typically last 20 years. They are very bulky for the amount of power they store, must be operated upright, and cost like the dickens. The phone companies had tons of them, and may still use them for all I know, to back up their central offices. I had some of these ex-phone company units several years ago. They were in glass cases, very big. I gave them away when I moved, pity.

Getting good electrical conductivity between all parts of the vehicle is always a good plan, but single point grounding has it's merits too, even after you've done all that nice bonding. Primarily it eliminates any possible common ground paths that may induce noise and, if it fails, gives you an inoperative radio rather than the "glitch demon from hell" that drives you crazy with it's weird intermittant noises.

>>It is a quite common occurrence. Ask the electrical technician at your

>affect the radio.

Unfortunately most people don't notice problems until they're sitting on the side of the road stranded with smoke boiling out from under the hood. You and I would notice, but we aren't the average motorist. Even so, straps have been known to suddenly fail without warning. I got Email from a fellow describing a problem with an MG where the bearings in the rear end kept failing. It seems the engine strap had fallen off and yet the engine still would start with the return path being through the transmission housing, drive shaft, rear end, bearings, suspension, and back through the body. The bearings were being electroplated away! This drove him crazy for *months*.

>>Would you consider cutting one lead of the 110 VAC cords on your line
>>powered equipment short and tieing it to your metal bench for the *ground*
>>return for the power draw? After all the neutral is *grounded* at the
>>power panel, what's the difference?

On John's question about use over a period of time:

The Williamson County ARC has for at least the last two years used a gel cell to power the Novice station for the entire field day activity. Radio was Yaesu 757GX, and it was definately _not_ operated QRP :-) The battery is rated 60 amp/hours (I think).

At the house our two meter station is operated exclusively on a gel cell. When the operating voltage no longer displays the freq properly on the LED display, we charge it up. 40 amp/hour battery.

More than one club meter keeps a gel cell charged via a solar panel.

Source record: 293776

"The Airlines and HT's"Jeff Schwartz inquires:
".....What are the airline policies concerning 2 meter
HT's aboard airliners.....?"

For what it is worth, in other words an antidotal tale of one man's experience after serval hundred thousands miles aboard the (generic) "Friendly Skies" may I add:
I have never once had anyone-'security personnel'-ever question any radio equipment carried thru the check points in US airports. This has been from cities all over the states. It seems that you are basically up against the local law when it comes to what you can take past the metal detectors. Those people are no different than the rest of us- some are just doing their jobs and use a bit of native intelligence, others are out to make both a reputation and your day. It goes without saying, how you look, dress and speak will directly influence how fast you transit thru their little sphere of influence. But there is nothing against you carrying a radio onboard a commerical (US) flight. Using it is another matter.

In the years past it was the captain of the 'plane that could determine what did and didn't go on aboard his flight. I have asked the attendants to speak to the captains on numerous flights, for permission to operate a hand-held. I would always ask before take off and surprisingly I would allowed to operate. Many of the captains would want to know the frequencies and power and such; also they wanted to be sure that it would not bother any of the other passengers, but I always was surprised at their willingness to allow what I thought must be illegal. Moral, it never hurts to ask. It may have changed. Certainly 2 meters has- ever try it from 37,000 feet? forget repeaters, and I don't need to explain that one. Simplex can be fun but as the years have past I have evolved into a reader-sleeper-window gazer and the radio stays in the bag in the overhead compartment. Not all captains allowed this, but a surprisingly number did. Continuing with--
Antidotal tales (or : things that happened to me. or: why I read this stuff-it could happen to me)
As recently as 1989 on board a United flight out of
Billings Montana my friend N3FWA asked the captain for permission to use her 220 (sorry, that should now be 222) MHZ HT. It was granted. From the t airprt I talked to her half 'way to Denver Colorado. When the plane landed he asked her how far she'd talked, and was amazed it did better than his aircraft VHF (108-136 MHZ) radios. I think another ham was born.

On one flight I asked, was invited into the cockpit, introduced to "K7+++" the captain, and given the go ahead. He asked which seat I had (over the wing) and said if there was space in First Class I could move up there, no charge, to get out from the wing's shadow. As I said it never hurts to ask! But Federal rule changes may have made this only a history lesson- Today I

like to sit and stare out the window.
****
Don't worry about the X-ray machines. They use such a soft voltage it doesn't do any harm. Some of my HT have begun growing warts on them from those machines, but they still work the same. Cameras loaded with film are a different story- regardless of what the 'security people' tell you. Have them hand checked and carry your film seperate- in a clear plastic bag speeds thing up.
Now if you are the type that likes to live life on the cutting edge trycarrying a handgun onboard, even with all your federal papers. But that's another story

Pleasant journey!

Message-ID: <1991Sep10.153941.5350@axis.dsg.ti.com>
Source record: 293682

Last year one of the magazines (sorry, references at the house) had a very positive review of the DX GAP. At the time of the review they were not advertising the 2 meter capability, but the reviewer tried it then and found it satisfactory.

A local ham told me the company changed the assembly h/w at some point in time and it was more stable and exhibited the expected bandwidth with the newer setup.

Their is no "tuning" of this antenna, the 80 meter coverage is determined during assembly, and the rest of the bands _should_ be under 2:1 vswr if properly erected. I've asked the company for their literature as I, too, am interested in buying one of these. Their phone rep was friendly and told me several Dxpeditions had successfully used the DX Challenger.

2560. HF mobile ant. advice

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-10 16:28:29 UTC
From: dstock@hpqmolm.sqf.hp.com
Message-ID: <16610054@hpqmolm.sqf.hp.com>
Source record: 293720

Johnm sent me an elmer request, his mail got here, my reply bounces, his query is of general interest, so I'll reply here.

The request was for general advice on mobile antennas with a view to 10m DX.

There are two final limitations; what your car can carry and the clearance heights of your local bridges, tunnels, power lines :-). Directional antennas are obviously unsuited to mobile use. Horizontal polarisation with an omni - directional pattern can be achieved with a "HALO" but any horizontal job will suffer from ground proximity directing your power upwards at a high angle. This leaves just the verticals (and, if you want to look it up, a thing called a discontinuous ring radiator which arrears in some of the ARRL antenna books - it looks like a horiz loop over a groundplane)
Most mobile antenna designs are shorter than resonant lengths, and use some form of loading to shift their resonance down to the wanted band - hence the usual plug together loading coils and whip sections.
The radiation from an antenna is predominantly magnetic field up to a few wavelengtha away, then the electric field develops and a "mature" electro-magnetic wave is formed. For this reason it is usual to measure antennas in their "far-field", say 20 wavelengths out. The effectiveness of an antenna is a function of how well the best bits, with the highest currents are put in the clear. Verticals of 1/4 or 5/8 have the most current low down. A base load coil used to reduce the length needed to give resonance, lowers the best parts still further. radiation is shifted upwards. Using a loading device higher up is better. The ultimate is no loading device and a resonant length. A capacity hat at the top is best if you can't get a resonant length. On 10m you have a chance, but remember those who want to work 80m.

The 5/8 is easier to match than the 1/4wave, the 1/4 wave has a lower drive impedance, it finds the average sized car a more effective groundplane. The 5/8 has more "gain" due to vertical directivity BUT its main output is high above the horizon. I think that you will find that a 1/4 wave puts more of your power in useful directions. There is an awful lot published on mobile and general vertical antennas, the above guidelines should, I hope, help people decide which to try. Antennas for limited space are marvellously unpredictable and you just have to experiment eventually.

Cheers ! de GM4ZNX

In response to all the hula balue aboe horizontal versis vertical polorization
on 220.
Whats the fuss about?
use an antennia that will allow either polarization. it is a simple matter to
build such an antennia on one boom and simply switch between vertical and
horizontal. The sattilite boys do it all the time.
as a matter of fact there is a company just now putting such an antennia on the
market for not only 220 but for all bands above 2 meters. these antennias can
be either poloraty or circular with direction switching.
They can be custom built to your specs as far as gain and polorization and the
prices are competitive with the big name junk aluminum peddlers.

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 026 (OPDX.026)
September 9, 1991
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn Packet Cluster Network, NT2X, WB3JFS, WB3LHD, WK3N, KJ3Q, K4CEF, KC8FS, W8GMH, KQ8M and WB8VPA for the following DX information.

3B7, ST. BRANDON. Jackie, 3B8CF, finally showed up as 3B8CF/3B7. His activity seems to have started on August 6th around 1230z. He will be active for 15 days on CW, SSB and a possibility of RTTY operations. Word has it he is running a 100 watts into a dipole. Jackie's daily CW operations will be on 14025 kHz around 1200 to 1300z. On SSB he can be found on Snookie's 21335 DX net at 1700z and also on the 14256 DX net around 0200z to 0300z. QSL 3B8CF/3B7 via 3B8CF's callbook address. UPDATE 09/08/91: 3B8CF/3B7 was on 28545 kHz around 1300 to 1400z.

5A, LIBYA. INDEXA net reported a rumor that a group of "CN" operators will activate 5A beginning same time around September 20th to the 30th.

9M2, WEST MALAYSIA. Esheeand, 9M2FK, would like to tell everyone he can be found on CW every Saturday and Sunday from 1030 to 1145z on 14017 kHz +/- QRM. He says after that time he has severe QRM from neighborhood applicances. Esheeand also likes to have QSO's and not just an exchange of RST. He is looking for contacts with North and South Dakota as well as VE4 and VE5 stations. His signal is usually weak, because he is only running 50 watts into a delta loop antenna. QSL 9M2FK via YU1HA.

CY9, ST. PAUL ISLAND. The Canadian government will be closing down the lighthouse and island because of new electronic automation is being installed. Word has it the INDEXA group is negotiating with the government to open up the island once every 5 years for amateur radio operations.

FR/G, GLORIOSO ISLANDS. FR5ZU is to sign /G this month or October, but there have not been any reports of activity as of yet. After Glorioso, he is to make a trip to Tromelin.

S2, BANGLADESH. Jim, VK9NS, was overheard saying that there will be six officially sanctioned stations operating in S2-land within the next couple of months.

VK9, COCOS KEELING ISLANDS. Peter, VK9YJ, who visits the island once in a while for maintenance, is active again on the Family Hour DX Net. Check 14226.5 kHz around 1130 to 1430z. QSL to: Peter James, Box 60, Lara, Australia 3212.

VS6, HONG KONG. Phil, VS6CT, said he will be looking for DXers needing VS6 for a new one during October on Saturdays and Sundays 0000-0200z on 28480 kHz.

XZ, MYANMAR. XY0RR continues to be active. The guys in the northen latitudes have had better luck this week working the XY. This weekend they showed up on 17 meters. CW activity was on 18070 kHz, SSB activity was on 18333 kHz and there was a report of RTTY operation going on 18081 kHz as well as 14081 kHz. Length of operations is unsure, but the following message from NT2X via The Tri-State DX Cluster may shed some light: (09/06/91 1304Z) "I've just spoken with Gena, UA9MA, one of the operators at XY0RR and this is what he has to say: They are operating from the Golden Triangle, not from the islands and using all wire antennas. Putting up the big log-periodic is dangerous; he hinted at their precarous position and that they are trying to keep a low profile. Four more days of operating from the same position and then they will have to move. (ed. meaning the 10th or 11th) Gena couldn't tell me if they are going to quit after four days. Over 40,000 QSOs have been made. The operators are "OK", except for Harry, RA3AUU, who has a stomach sickness. Unfortunately, they are under considerable strain from the operation and are getting "battle fatigue". They are also eating only once a day. (Gena didn't explain why.) Clarification was made about operation between September 6-9, on 21 MHz. They will only be QRV on 21035, anyone operating on 21020 is a SLIM. A request had been made to cut down the spread of 100 kHz. Gena's reply was: "Everyone is awfully weak, we have no choice but to go wide, otherwise we can't hear well." I also suggested to go by call areas and the suggestion was taken. I don't know if and when I can provide the next update, so try to work them while you still can, don't waste any time now."-- 73's de Ed Kritsky/NT2X

YA/T6, AFGHANISTAN. It was reported in the INDEXA Net, that Jacky, F2CW, is waiting written permission and documentation to operate from Afghanistan. Also, INDEXA reported the T6AS group's documentation has been approved by the ARRL, but there has not been an official announcement made yet in the ARRL Bulletins.

ZA, ALBANIA. All the press releases and information look very promising on the upcoming ZA operation. Starting day could be between September 12th thru the 15th. The callsign of ZA1A will be used and the following frequencies will be used: CW 14020, 21020 and 28020 kHz -- SSB 14145, 21245 and 28345 kHz. Let's hope the Amateur Radio Community will be on their best behavior for the Albanians. There should not be any problems as far as operating techniques, because the Albanians are being taught by well qualified DXers. Sponsoring organizations include the IARU, ARRL, ARI, JARL, NCDXF and Yaesu. QSL route for ZA1A is via NCDXF, Box 1, Los Altos, ca 94023. Bureau QSL cards will go via W6OAT.

What is this VOX stuff anyway? Is this the device Mrs. Fletcher uses
when she says: "Help me, I've fallen and can't get up!"
or
is it like the clapper (or jacker), you know: "Clap on. Clap off?"
Heard any good jokes, lately?

Whats PTT anyway, Praise The Transmitter :^?

I saw a photograph of a young girl with glowing fingernails; the caption said that she worked at a radium plant, and that such stunts were routine. I myself had a World War II vintage aircraft sextant that I kept as an antique. I happened to place a giger counter near it one day (yes, I happen to own a giger counter, and keep an informal record of background radiation records), and the sextant drove the counter right of the scale! It was hard gamma, too, as a three-inch thick steel anvil placed between the sextant and the counter had no effect on the count. I ended up calling our state radiological officer, who came right out, placed the thing in a lead-lined container, and sent it off to the Dept of Energy for disposal! Those old optical instruments can be really hot, so watch it.

The September 1991 issue of IEEE Power Engineering Review
has two very interesting articles on the effects
of solar flares and the solar wind on the power system
grid and communications systems.
Those of us who are used to dealing with microamperes
and maybe amperes to power rigs don't usually
pay attention to a power journal with mega-amperes.
Check this issue out.

The other good use (I think) would be for the case where your power supply
isn't quite up to what your rig needs on transmit. So the battery discharges
on transmit and charges on receive (or when not operating). As long as you
aren't too much of a motormouth you won't deep cycle.

>interested in operating battery powered over a period of time or an event
>(like Field Day or a camping trip) in order to avoid the use of a noisy

If you know you will consistantly deep cycle the battery, then NiCd's
start to look better. Other factors: Does weight matter? Do you need
to be able to tip it over without spilling anything?

>the HT, a portable dictating unit and tapes, floppy disks, an IBM convertable,
>and a camera & 35 mm film. (I usually ask that the camera and film be hanc
>checked, but have forgotten and let it be x-rayed.)

In general, the denser the circuitry on a chip, the more sensitive it is
to damage from x-rays etc. I think the damage is pretty much cumulative
and linear (many small doses == one big dose).

Some processes are more resistant than others, but most owners of electronic
toys have no way of knowing what scale the IC's are or what process.

How concerned you should be I guess depends on how often you fly and how
hard it would hit you financially if your HT mysteriously stopped working.

I always ask for hand checking of sensitive toys. Only once have I been
refused (in Holland).

Gap Verticals,

Well, just been spending a bunch of time testing out my new Gap Vertical. I went to a big ham fest and was going to put up a tower and a beam. Got talked into the Gap (time and money considerations). I had a Parallel dipole (10,15,20,40,80) and a seperate 15m dipole. The parallel was a real pain tuning, and finally found it so narrow banded, I bought a tuner-it workd real well and did a lot of DX and did real well in pileups. The 15m (about $7.50 not including the cable) is resonant across the entire band and I can work anything I can hear-including getting through most anywhere on 80 watts against some kilowatts with Yagis and other directional antennas.

The Gap doesn't need to be tuned. It is very simple to put together (about 45 min) the only hard parts are to bury the counterpoise wires and cable. It met all claims as to the SWR on bands it claimed, and did a little better than it says on a few. If you want an all band antenna that you won't need a tuner for, that won't cost a lot it is pretty hard to beat.

I have done a lot of comparison between it and my dipoles. The 15 meter dipole almost always beats out the gap. Sometimes it is 2-4 s units better. I can sometimes not hear things on the gap that will come through on the dipole. When I use the tuner with the parallel dipole it will most of the time also beat out the Gap by a little. I have found that most of the time that I am not on 15m I use the Gap, because I don't need to use the antenna tuner, and having a tube rig, that becomes a big convenience. I have worked a good amount of DX with it and got good reports. My friend has one with a kenwood 440s and loves it. Everyone I met at the ham fest swore by them.

If you are looking for inexpensive, versital and does it all I think it probably will beat out almost all other verticals and many other antennas, if you are looking for top performance it may not be the way to go

>-----------------------------------

Well, I think some folks need to get their facts straight.....

FACT: I own a Heath 'Most Accurate Clock' and have had it since about 2 months after they introduced it (sometime in 1988, I believe). I've had various and sundry problems with it over the years, related primarily to the heat the thing generates internally and the general lack of stability in their tone decode circuitry. HOWEVER, it was in 'HI SPEC' last night, and continues it's 'normal' operating pattern of being in 'HI SPEC' (ie, it has synced to WWV in the last 10 minutes) about 17 or 18 hours/day (except when a PCA or other solar 'event' knocks out reception, as happened much of August). So, let's put this one to bed. Followups to /dev/null, please.

Now, there ARE some well-documented (ie, Heath will TELL you about them, and they have been written up in several magazines) problems with the GC1000, most of which center around the sensitivity of the tone decode board to heat, misuse, abuse or general wear and tear. I've had mine open (the clock) about 6 times over the years I've owned it, and EACH time I've opened it, I've had to go back later an REopen it to readjust the tone decode. Also, the Heath manual's method of adjustment is NOT adequate for reasonable operation with anything but a 20db over S9 signal. To get reasonable (ie, 'HI-SPEC' often enough so that it will continue to display the .1 second digit, about once/day) operation, one MUST use a counter to accurately adjust the tone decode circuitry. Heath will tell you (at least they told me a few years back and I wrote it down at home) what to do if you call 'em.

Yeah I remember those "hummer" guys from college days. They think high frequency is 61 hz. On the other hand we digital guys think high voltage is 6 volts and the microwave guys think anything under a ghz is DC! All in one's perspective I suppose.

Yep, the same distributor that put out AntenneX handled the book...when they went belly up, I still had about 8 or 9 issues remaining on my AntenneX subscription. Quite a nasty mess, I understand, from what Pete, KH6CTQ, told me about some telephone conversations he had with W5QJR about the folding of AntenneX...bottom line was that it looks like we'll never see the rest of that subscription (Pete got burned, too...).

>people doing the work look incompetant. Another is that the photogs want
>pictures, not info. The "wait here until it's all over and then the PR
>guy will tell you what happened" attitude will ruin your good publicity.

I think you missed this one a little bit. There is a difference questions between "What is happening?" and "What are you doing?" The first question is being dealt with by the poster, while your dealing with the second.

They are quite different in scope. The RACES bulletin is ABSOLUTELY correct about not giving out information about the event. That isn't the ham's job. The answer isn't "I don't know." but rather "I can't help you with that, please go see the PR Officer."

It is a completely different matter to blow-your-own-horn with the press about what you are doing, and this can be done without giving ANY information about the event itself....thus answering the 2nd question.

>The workers need to learn the difference between fact and opinion and
>be allowed to give the simple facts. "We're amateur radio operators and
>we're passing messages between this cammand post and the one at the
>hospital" will get you a much better understanding by the community than
>the "go talk to the PR flack" response.

Lastly, it isn't our place as ARES/RACES to change the stated policy of the agencies we are trying to help. That last word is the key "HELP." It isn't helping the served agency or ham radio to have the operator or entire group tossed out of the operation for not obeying the policies of the served agency.

>>how well the ear-mics work.)

Maxon earmikes work very well. They are sold private labeled for
radio shack in addition to their brand name. A friend and I used a pair
for communicating while on dirt bikes. The VOX is nice - except when
ya gotta say "OH SHIT".

>There are some ear-mike and throat-mike gear advertised in the land mobile
>trade rags, but other than Maxon. They don't advertise consistently so
>you will probably have to still hunt around.

I have some literature around here on a couple of brands. The commercial
stuff is VERY expensive. By VERY I mean several hundred bux. The Maxxon
stuff works fine for non-military/police work so give it a try.

Subject: Re:Request for Info/Help: CW "Decoders"
From: wk@frc.maf.govt.nz (Wilbert Knol)

Jerry,

My advice would be: don't waste your money on CW decoding machines.
I've yet to see a device that will allow you to reliably conduct a CW QSO
on any one of the HF bands.
Without exception they drop out of sync at the first burst of static or QSB.
Employing PLL type and LP filters they won't decode while tuning (as you
would by ear), nor will they copy chirpy or drifting signals.
Also old timers still doing the old 25 wpm at 75 years of age can be a
problem, you'd need a combination of pretty good hard- and software to
simulate the flexibility of the human brain to be able to copy some of the
stuff floating around our bands.
However, some modems work well in the relatively QRM/QSB free environment
of the VHF and UHF bands and even on HF you can get the odd station at 599+
sending machine generated CW. If you are happy with that, by all means, go
to it.
For serious CW QSO's on HF there is only one option: copy by ear.

> Seriously, though, I doubt that the fairly low levels would be dangerous.
>There may be some small gamma emission, but compared with the output of
>soft X-rays from a good transmitter, it's probably minimal. Those 833's
>though, I would check...

So long as the material remains IN the meter/dial there is no problem.
If the glass breaks or you open it for any reason there are two dangers
as pointed out (1) the radon gas and (2) the actual radium/phospher.

When I worked with the dials (back in the 60's young man Hrrrumph), we
were told to be sure that the coating STAYED on the dials and be VERY
sure to wash it off before eating etc..

The problem comes from ingesting tiny amounts ofthe material since it is
then in very close contact with your tissue for a very long time! That
will certainly cause a cancerous tumor in time. How long depends on how
much material, how long it is there, how active it is and your
particular metabolism.

I would suggest that if the case is even doubtful it is simply not worth
the risk. A replacement meter is around $10, a new body costs much more
:-).

Note to those with the RFC 2-23 two meter amps. They should allow between 2 and 5 watts in and operate fine. Turns out they have made a few revs of the circuit, and in middle rev changed the SWR detect. It is too sensitive, such that OK SWR but high power can cause the amp to lock out until you power cycle. I had a new one that worked fine on 2 or 5 watts input, and another 2nd hand one that only worked on 2 watts in. Decided to investigate and found this to be reason.

I called manufacturer and they had me send in the unit, and fixed for no $$. Don't know if that deal always applies but I thought it quite nice.

[Disclaimer: This was case for me some months back. If you have a unit that you don't believe will allow 5 watts input, please check with factory before you try it. I certainly don't want to cause any problems with your amp!]

2584. Radium watch...

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-11 00:37:02 UTC
From: nessinger@atmo3.atmo.arizona.edu
Message-ID: <1991Sep10.173702.1@atmo3.atmo.arizona.edu>
Source record: 293704

Any watch that has been coated with radium is not strong enough to have any strong health risk. BUT that all depends on where you keep it. A wrist can be exposed to more radiation without danger. But your eyes, gonads or other vital organs are more sensitive to radiation and have a higher risk of damage. So a wrist watch with radium shouldn't pose any danger while a pocket watch would. But on the other hand (the right) no exposure is best. If all else fails, give the watch to a high school or college for a demo of radiation.

P.S. Radium isn't a gamma emmitter, and if it were a geiger counter (GM tube) couldn't detect them.

> N5OFQ

Don't worry about it. No electronics of the type you find in scanners
is going to be affected by X-Rays of that energy and intensity. At
least not permenantly. Sensitivity is a function of complexity. Communications
sattelites are a LOT more complicated and take a lot more radiation than
that.
Possible exceptions: Magnetic media, although I have never had a problem
with such. Some sorts of very high density non-volitile memory might
also have problems if left in the X-ray for a while.

Within the last few years I have heard about trunked radio systems, but know little about them. This weekend one of my friends showed me his trunked radio he uses with the sheriff's office. Each time he keyed up, the radio would beep three times from the speaker. He also had a function on the radio was able to check if he was paged.

How are trunked radio systems different from standard repeaters?

2589. Re: Zero beating a transceiver

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-11 09:47:43 UTC
From: dstock@hpqmolm.sqf.hp.com
Message-ID: <16610055@hpqmolm.sqf.hp.com>
Source record: 293790

I find that I need to have my sidetone and the beat note of the incoming signal at different pitches to avoid confusion, EG. when someone breaks in while you're running full QSK.

There is seems to be no way to truely zero-beat an incoming signal with the modern Japanese sets, in the way that used to be used in the old frequency measuring competitions.
All the suggestions to date make the assumption that the RC sidetone oscillator is at the same pitch as a signal exactly netted would give. The stability of crude RC oscillators is very poor compared to the sub Hz precision that could be achieved by actual zero beating if you used a seperate Rx to hear the beat between your Tx and the incoming signal.

OK, I'm being pedantic, but the original questioner used the term "zero-beat", so a thorough answer should explain the special significance of the words. As his requirement was for advice on placing his transmision within the other guy's passband, The tune-until-his-note-matches-your-own-sidetone process will work, PROVIDED CW pitch (aka BFO) and any sidetone pitch control are set appropriately. Some practice at tuning to and fro across his signal and then stopping roughly in the centre is quite successful and allows you to keep any pitch controls at the settings you prefer for the actual QSO.

The G-QRP club along with many similar organisations conducted tests and a survey, they found that most (but not all) found CW easier to copy, and more comfortable with a pitch in the region of 500Hz. My main HF set has a "cw pitch " control and I find it most comfortable set to about 400 Hz. The sidetone is set by component values to roughly 800Hz

To get sidetone while receiving, I must switch off Vox/QSK

I must then either tune to a pitch 1 octave below my sidetone, or set my BFO to its centre detent and tune for a beat then return the BFO to 400Hz

I must now turn on Vox/QSK to be able to transmit

This is a nuisance everytime I want to net onto a signal, so I just guess the centre of my passband - a narrow filter helps. Most people I know just tune instinctively like this.

THE BEST solution is rare nowadays, the Tx carrier oscillator can be used in place of the Rx BFO by pressing a single button near the main tuning knob. this causes the tone you hear to pass through 0Hz exactly ay your transmit frequency equals the signal frequency. This occurs smack in the middle of your filter passband too. It's so easy, poke the button, tune for zero frequency (a true zero-beat) let go the button, transmit. All other controls are not touched, you are within Hz of your target FAST and ready to go with your favourite settings undisturbed

It is rather a shame that "spot" or "net" buttons are rare.

With the new homebrew rig, I'm using a DDS synthesised BFO. All synths are locked to one master reference standard oscillator, so I can arrange this without any extra hardware. Many thanks to all in this string, you have caused me to plan this area better than I would have done otherwise.

Shouldn't topics such as: HR 1674, scanner laws, ht's on planes, and restrictive covenants be posted to rec.radio.amateur.policy rather than to this one? The definition of that group is "Radio use & regulation policy". I realize the definition of this group is "Amateur radio practices, contests, events, RULES, ETC. (Caps mine - for emphasis). That's a bit confusing (rules in one - regulations in another). If I remember rightly, the other group was formed to rid this group of unending "no-code" arguments, etc.

If the policy group is now to have a reason to exist at all, it has to be considered as being more than just "a place for people to post controversial things I do not care to read".

If items dealing with airline regulations, policies on scanners, and rules about antennas continue to be posted here, what is the purpose of the other group, and why should it continue to exist?

2598. RS scanner mods?

I have a few questions and comments about the Radio Shack 400 channel scanner, model 2004, or 2024, I think.

I want to perform the mod to increase the scan rate.
What diode do I cut and where is it located?

It's to bad that RS did not include an S meter in that *HUGE* LCD display that this unit has.....

Does anyone know of an S meter kit that can be somewhat easily installed without hurting the performance of the scanner?

I am VERY please with the performance and features of this scanner.
I just wish it came stock with an S meter.

Mucho Thanks!

Trunked radios (sounds like a Motorola system your friend has) has a series of repeaters at a single site. One of the repeaters is a control channel with a continuous stream of data coming from it. The mobiles read this data stream to determine the status of the site. When the mobile wants to transmit it sends a data stream to the control repeater which in turn assigns the mobile which repeater to connect to. Each time the repeater unkeys the assignment may change. The sites may have up to 20 repeaters linked through the central controller. The 3 beeps mean that a channel assignment was made. Each radio is given an individual unit id as well as a fleet id for all of the units in the company. Each fleet is unique from every other fleet. From the mobile unit there is no way to monitor other conversations on the channel. The control channel regualtes traffic flow. Telephone interconnects are also handled through the control channel. A repeater is linked through the phone line and attached to the mobile. Depending on the radio a full duplex conversation can then be started. Motorola is in the process of linking trunked (SMR) sites together with data systems to provide a nationwide data communications netwrok with mobiles. Trucking companies are the primary target for this service.
Non Motorola systems use a different approach. The repeaters at the mountain site each transmit a short burst of carrier at 30 second intervals. The mobiles then determine which channel is available and connect through a free repepater. Almost all of the smarts in these systems are in the mobile. The Motorola system has smarts in the radio and in the central controller at the repeater site.

Source record: 293725

Steve Schallehn was asking about these; basically all the radios are frequency agile; you do not know between successive mic-presses which frequency you are going to transmit on. When 'idle', all the radios listen on one common control channel; the base station or repeater transmits a constant signal on this frequency (this signal contains information about the base station, such as what frequencies are available from it; the receiver can also use this signal to, for example, measure the strength of signal from the base/repeater and so decide whether the signal is good enough to give an acceptable service quality).
When you hit the transmit switch, the repeater & mobile both agree on a frequency to use, tune to it, and you get your link. When you de-key the transmitter, the frequency you were using is released for use by another person. If you are out of range of the repeater, you cannot transmit. This has advantages where people drive from one area to another; with normal CTCSS-type radios you can transmit on a frequency allocated to someone else if you happen to move into a different geographical area; with a trunked system, unless the repeater 'gives you permission' to transmit, you do not get a slot and your TX is disabled.
Its also possible for the mobiles to dynamically tailor their power output on the basis of the signal received on the control channel; this reduces 'spill-over' between regions and allows frequency re-use on a finer scale.
This, and the dynamic frequency re-use, result in greater efficiency of spectrum utilisation (something we must encourage, since it helps to take some of the pressure off *our* bands!).
The 3 beeps are produced when your transmitter has moved to a frequency under command of the repeater, and you are allowed to start speaking.
Because its all digitally controlled, the control channel can be used to broadcast paging-type information to the mobiles. Theres also the ability to interleave voice and data; the control channel may be used to send special alerts, group pages etc.
This is how the 'who called you' information can be passed. Its also possible for a user to 'ping' each mobile to see if he has his radio switched on or if he has switched off... Big Brother is watching.....!

Another big advantage to the users of such a service is that its harder for people with scanners to listen in, since the frequencies in use change between 'overs'. In order to follow such conversations, you would have to have a receiver that could decode the digital squawks and work out which frequency to tune to.

Finally, the best thing (from the perspective of the service-provider) is that you can account for the time each registered user has spent talking, and then invoice him for it every month.....!

Here in the UK, a trunked system has been established in the frequency band 174-216MHz following the total closedown of VHF TV broadcasting some years ago.

QST QST QST...

On Saturday, November 2, 1991 the Annual Nampa, Idaho Hamfest will be held at Nampa Civic Center from 8:30 a.m. to 4:00 p.m. This hamfest will specialize in new and used Amateur Radio Gear and Personal Computer Equipment. This is an ARRL affiliated event.

The gathering last year was very successful and we will have more dealers present this year from the surrounding states. There will be seminars, VE testing at 9:30 a.m. (walk-ins welcome) and self-contained RV parking.

General admission is $2.00. Dealers will get two 8 foot tables and admission for one person for $60.00 and must pre-register. Non-dealers may receive one 8 foot table space for $5.00 preregistered and $7.50 for at-the-door registration plus free admission for one person.

Each admission includes a free raffle ticket for the possibility of winning a handheld radio and other prizes.

To preregister for a swap table send your name, callsign, address, and phone plus check or money order to Nampa Hamfest Committee, c/o Jay Dyer WA7VEF, 2013 S. Powerline Road, Nampa, ID 83686.

For further information call WA7VEF Jay Dyer, (208) 467-3245 or KA7BER Elvin Hightower, (208) 466-2011 in the evening MST. You may also e-mail me for more info.

The Nampa Civic Center is at 311 3rd Street South in Nampa Idaho (18 miles west of Boise in Southwest Idaho). Talk-in frequencies are 147.84/24 & 448.600/443.600. Dealer setup is Friday evening or Saturday morning.

Several people have commented on the importance of proper use of fuses for mobile installations. Does anyone know of a good source of in-line fuse holders? Radio Shack only has some light duty ones. I would think that for proper installation of a 45 watt mobile rig you would use 12 or 10 guage wire and an 8 or 10 amp fuse. A 100 watt HF radio would use even larger components.

I shall gather some info and send it. I have a program in GWBASIC, I'll
send that straight and also uuencoded if you have uudecode to recover it.
The program lets you play with different values and see the results, e.g
it calculated the capacitor on 80m for my loop (hexagon 8 x 2.5 ft) 397Pf and
I measured 394Pf. The antenna is made of copper tubing (aluminium he30 also)
bent to form a circle with a gap (say 3 in.) at the top, a capacitor with
reduction drive is connected via heavy straps/wires across the gap, soldered
or welded. The bottom centre has the outer braid of 50 ohm coax soldered to
it.the coax inner attached to the loop at a point 1/10th the loop circumf.
along from the point where coax braid is, adjusted to find lowest swr point.
1. Shape not critical, can be a square, hexagon (approx. a circle) or circle
(ideal).
2. The capacitor has very high voltages across it on transmit.
3. It is very narrow band, my brother thought his was not working, then
realised it was off resonance and he could hear nothing.
4. Loop circumference needs to be less than .25 wavelength at highest freq.
e.g a 3ft dia. loop is great for 20 - 10m inclusive, provided you have
a capacitor that goes down to about 5Pf needed on 10m.
5. Most efficient capacitors are vacuum and split-stator.
6. 100W gives about 5kv across the capacitor, so wide spaced is needed
7500V/in is the design value. I used a small single gang cap in my loop
max was 10W for the spacing, at 15W you could hear the flashover.
7. To tune.... adjust on receive for max signal strength/noise, go to Xmit
and adjust capacitor again for lowest swr.
Bandwidth is only a few Khz, so you have to retune when you move freq.
BUT IT WORKS FINE! ....
I haven't got the original QST article, I've only got an extract from it
and that was adequate.
*** Indoor/restricted-space antennas *** article by

The problems with magnetic media and x-ray machines aren't the x-rays
themselves but the big honking mother magnets that they use in order
to run the machine itself.

Message-ID: <1991Sep11.174137.10583@techbook.com>
Source record: 293780

Last time I checked into it (I asked the airline and also read the airline "magazine") You should not use any radio for transmitting or receiving unless first cleared by the Captain... I asked the Captain and he didn't know so checked on his airline's policy. Their worry is that the local oscillator in the radio might interfere with thier radio and navagation devices. There are some restrictions regarding computers as well.
Another thought... Eproms may be erased by uv light.... and Xrays as well. The intensity and duration of exposure to XRays in the airport security devices is, however, not likely to do the job, though. Once I carried a commodore 64 disk drive in a back pack on an airline and they asked me to plug it in and prove that it worked (and presumably not something else). I had no power cord or computer with me and couldn't do it. An airline representitive had to come to the security gate and give his approval for me to take it. Luckily, the plane was late due to bad weather.

> So we are perhaps radiating at about the limit for amateurs anyway...

Huh. 2500 Kcal = 10.467 Megajoules divided by 24*60*60 seconds per day
gives 121 watts per person. You can't get more out than you put in.

If you can get 10 times the radiated power as the chemical energy
input, the Department of Energy would be real interested. Call
Carl Sagan, call Pons, call Fleishmann -- not only have we solved
the energy crisis, you've found the missing mass of the universe. ;-)

Source record: 293796

> Corallary question: What is the easiest way to get 7.2V out of 12V
> at about a coupla amps or so?

Hum, let's try Ohm's law. 5 volts / 2 amps = 2.5 ohms.

The power dissipated will be 10 watts.

With a little tinkering with the resistor value, you should be able to
adjust the power out to the value you desire. Of course, on receive,
the voltage will jump up to 12 volts, but that should be no problem with
that HT. Unlike the suggestions of dissapating the RF power, you can
even use wire-wound resistors and not need to use coax connectors.

Amid the clamor about the potentiality for R-390 owners to glow in the dark, one question hasn't been answered: what's an R-390 or R-390A? I gather it was a military receiver. What were it's specs?
As an asside, although radon gas **can** be a problem in home basements when the houses are too tightly sealed, I doubt that the amount of gas emitted from a meter after the glass has been broken is enough to worry about -- unless you live in a sealed container. Radium is a problem if you eat it but I don't make a practice of licking my fingers in the ham shack. I also wash my hands thoroughly before meals and don't snack in the shack. Alpha particles won'd even penetrate the skin on your hands -- I handled isotopes in physics labs in college barehanded all the time (the old AEC would have had a cow, but what the hay!). Moral: if you've got a R-390 or R-390A, don't eat it for breakfast! Gives new meaning to brushing after every meal, no?

Message-ID: <CMM.0.90.0.684614330.freeman@watsun.cc.columbia.edu>
Source record: 293778

Amid the Sturm und Drang of the code/no-code license debate and the debate over waiver of high-speed code exams for handicapped hams (I think this sucks, BTW), it occurred to me to wonder if anyone has gathered in one place or reference all the changes in privileges/freq allowances/exam requirements/logging requirements/etc for the amateur service from, say, the establishment of the Federal Radio Commission (FRC) in 1927 to the present. The chronology of such events as, say, the eleimination of classes A-B-C in 1951, the reintroduction of "Incentive Licensing" in 1967 with Docket 19582 (I believe), the modification thereof in 1968/1972 due, in part, to low occupancy of the Extra CW bands, etc., would be interesting. If such a reference exists, could one hope it to be in recorded form or in Braille or in machine-readable form (he said, hopefully)?
Amateur band freq charts over the years would be fun, too. (Don't we wish we had the 2.5-meter band just prior to WW2 -- 110 mHz and above?)
Thanks in advance.

2617. RTTY/ASCII Code conversion HELP?

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-11 20:13:25 UTC
From: cole@jazz.concert.net
Message-ID: <1991Sep11.201325.21169@rock.concert.net>
Source record: 293785
Cross-posted to: rec.radio.amateur.packet,rec.radio.amateur.misc

Greetings!

I am attempting to convert a file (of which I assume to be RTTY) to SOMETHING readable (which I assume to be plain text). To help explain, here's a sample of the original file:

a:MaORl5\DI2>X1Hf\jO=9k5U>2[mJI__ZPBacJgg3f]4HoLf@Fhl?mWc0SkNJ (more and more)

I have coded a C program that extracts 5-bit values from the above stream, and compares those values to Table 11 on page 19-19 of the 1990 ARRL Handbook. For example, with an initial offset of 0, the program produces:

OWDFOHXL<FIGS>-6.+/"<SP><SP>)('/<BEL><BLANK>+/")8?.&<SP>./:0,6629)0064)6/<LTRS>PSE<LF>OPFR
BPMWBSHHLIXNB<SP>EIGIT<LTRS><FIGS>6/-,'/<BEL>!<BEL>/'2<SP><CR>4

from the above example snippet.

The program would of course produce different results with an initial offset, but it's all garbage anyway. Has anyone ever done this succesfully? If you're wondering, this data was captured by a Mac running AEA PakRATT hooked up to a TS-440 (I forgot the frequency.) I also assume that all data transmitted is present in the stream.

This began as an interesting diversion, but now IT'S DRIVING ME CRAZY!!! I would really like to see something useful come out of this, but if it's not possible to do, then I'm bailing out now before I waste much more time.

What help can you give? What about parity, start/stop bits, data loss, bit inversion before conversion? Any and ALL _explicit_, _detailed_ HELP will be greatly appreciated!!!

Has anyone tried the homebrew plate glass capacitors described in the second antenna compendium for use with a loop? These consist of two metal plates (one fixed, one moving) separated by a thin sheet of glass. The author claimed greater than 10kV breakdown. He used a simple screw drive to move the upper plate. This linear design has no sliding contacts so it should be low loss.

Message-ID: <0094E7DB.073142A0.15649@hg.uleth.ca>
Source record: 293726

/\

MIDDLE LATITUDE AURORAL ACTIVITY WARNING

DOWNGRADED: 21:30 UT, 11 SEPTEMBER

/\

MODERATE RISK PERIOD: 12 - 13 September (UT days)

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: LOW - MODERATE

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: >55 North Latitude

POTENTIAL LUNAR INTERFERENCE: LOW

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: FAIR

The Middle Latitude Auroral Activity Warning has been downgraded to a WATCH.
Auroral activity peaked during the UT day of 10 September and provided some
fairly impressive activity over many middle latitude regions. Conditions
have since stabilized.

Auroral activity will again become moderate to possibly high over the high
latitude regions. This activity should be sufficient to produce moderate
levels of activity over the northerly middle latitude regions, and low to
moderate levels of activity over some north-central latitude regions.

This WATCH will remain in effect until 13 September. Most of the activity
should occur during the UT day of 12 September. For North American
observers, please note that this corresponds to the evening and early
morning hours of 11/12 September.

** End of Warning **

>make sense for us to be able to talk to each other.
>Since there are far more FMers than SSB/CW ops, it seemd logical to
>propose that we SSB/CW people do the changing to vertical polarization.

Oh, so what you REALLY are saying is that you want to use the
SAME ANTENNA for both SSB/CW and FM.

I can see that for someone with only one antenna, this is an advantage.

However SSB/CW work typically requires a tight narrow beam antenna that
is well optimized for its portion of the band (typically 300 to 600 kHz
of good performance). FM sometimes uses beam antennas, but much more
often uses omni-directional antennas even on a base station tower.

One can make one antenna serve both types of operation, but neither
will be served well. The best combination is a beam for SSB/CW and
an omni for FM.

Personally I don't think the tradeoff of losing the polarity isolation
to gain the ability to use a comprising antenna is worth it.

>dark, one question hasn't been answered: what's an R-390 or R-390A? I
>gather it was a military receiver. What were it's specs?

The R-390/URR and the R-390A/URR are early sixties vintage navy HF receivers. They cover 0-30 Mhz in 30! bands. The frequency display is a Veeder-Root odometer type dial counter which reads in Kilocycles with one additional wheel indicating tenths of Kc's (hundreds of Hz). Tuning is done using two large dials, one for Megacycles and one for Kilocycles. It's a real pain, for instance, to go from 3980 to 4020 Mhz - you have to turn the Megacycles dial one click to the right, and then the Kilocycles dial about nine full turns to the left.

Both radios - and they are totally different inside - were designed by Collins however there were other second source manufacturers including Capehart and Motorola. The most sought after models naturally come from Collins. Collins spent $2 Million developing just the VFO module and at the time it was an extrordinary expense for the company.

The R390A is by far the better of the two. It has 4 of the nice Collins mechanical IF filters plus an 800 Hz audio mechanical filter. Selectivity is adjustable in 6 ranges from 16Kc to .1Kc (100Hz) Great for CW on just about any band, however, fine tuning is sometimes difficult especially if the main tuning dial does not turn easily (which is common).

The rig was not made to receive Single Sideband however by carefully adjusting the BFO frequency and the RF Gain, it can do a fair job at it. There was a "sideband adapter" for it, but I don't know the military nomenclature and have never seen one. There have been several "product detector" mods for the rig, but I've yet to run across one myself. Anyone have any info on this?

The internal construction was somewhat unusual. There are virtually no variable capacitors in the tuning circuits, everything is done with PTO's (Permeability Tuned Oscillators) and Permeability Tuned IF's. The First IF frequency is variable, and there is a rack of about 30 tuning slugs which move in and out of the IF cans using a very complicated multiple gear and cam arrangement. I've got one of the original service manuals and the radio alignment procedure is about 50% mechanical, 50% electrical.

There are more gears in the these things than in your average Mazda - it looks like a clock factory in there :-).

If you look up the word "anchor" in the dictionary, you'll likely see a picture of an R-390. The 390A weighs in at about 75 pounds and the dimensions are roughly 12"H x 19"W X 16" deep. Better wear your steel-toed boots when handling this one.

Despite it's unusual construction, it's a great performer overall. It's admired my many of us who really appreciate how "real" radios _were_ built.

Rumor has it that the Navy still uses the 390A on some of its ships.

There was also a 391 and a 392, but I've never seen or heard of what they look like.

Despite this somewhat longish posting, it doesn't begin to scratch the surface on the series. You'll just have to get one and see for yourself. Prices range from $50 for a junker 390, to around $600 for a completely reconditioned $390A. Typical 390A's are in the $150 to $300 range.

2628. ALINCO Transceivers - any good?

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-11 23:00:04 UTC
From: donrm@hpnmdla.sr.hp.com
Message-ID: <14570162@hpnmdla.sr.hp.com>

Hello Net

I was looking at the ALINCO DR110T and DR112T twice-meter mobile transceivers.

The price on these radios seem too good to be true...about $300 new.

Is ALINCO any good? Anyone have one? Anyone have trouble with servicing the units? Why are they so cheap compared to the rest of the market? How do they perform on packet?

Thanks
Don Montgomery, K6LTS

]power, who can make sense of all the contradictatory advice given in
]this newsgroup and who can afford to buy more batteries (with no
]expense to you, of course) if they picked the wrong advice! :-)

Or, you can call the manufacturer (like I did) and get the straight
poop in their applications data book. Then, you can even post from it
and get flamed because you are "wrong."

Chuck, I am assuming what you want to build is a balanced wire tuner. The best advice I can give you is to purchase the book Practical Antennas for the Radio Amateur by Robert Myers, W1XT. (SCELBI Publications, P.O. Box 3133, Milford, Connecticut 06460. There's a good section telling you how to do just that, with various coil and capacitor sizes, etc.

I just built one using a 500 pf and 150 pf capacitor along with a B&W 3026 coil (2" diameter, 8 t /in #14 wire). I used a dip meter to see how much of the coil I needed to resonate at various frequencies with my capacitors and built accordingly. (6 Turns, actually, lets me cover 80, 40 and 20 with a switched in 220 pf fixed for 80M). I use clips to attach the antenna to the appropriate locations on the outer coils (found by trial and error).

I use a 3.5 Mhz doublet fed with 450 ohm ladder line and my tuner to cover 80, 40 and 20.

If you need schematics, etc, e-mail.
73, Bob

This is not always true in other countries. Several years ago I flew
twice a month from Vancouver BC to Ottawa ON to give a lecture at the
Emergency Preparedness College in Arnprior. I never had any trouble at
the Vancouver end, but there was always some officious twit at the Ottawa
airport who would insist that you remove your battery from the radio and
seal it into a plastic bag. Presumably, this was so you couldn't use it,
although no one ever checked to see if you put the battery back in. I've
never tried to use it enroute, tho, I always had a low estimation of the
rf shielding of aircraft avionics.....

2633. sat rcvr manf info needed

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-12 03:23:05 UTC
From: rrw@naucse.cse.nau.edu
Message-ID: <4171@naucse.cse.nau.edu>
Source record: 293793
Cross-posted to: rec.video,sci.electronics,rec.radio.amateur.misc

I've tried the following request twice in rec.video.satellite,
but gotten no response.

I'd greatly like to find the manufacturer's address or other
contact information for the following vintage (circa 1985)
satellite receivers:

1. TOKI model TR99
2. Royal-Sat model BR300

Specifically I'd like schematics (on the BR300 so I can modify
it for VCII compatibility) or other information (on the TOKI
so I can find out what the specs on the LNA/converter are).

Please E-Mail... I'll gladly pay cost of photocopying if you
have a manual on one of these.

THANKS!

rest deleted.

Yes, but would the ham be willing to give up the right to restrict their
neighbors from tending cows or operating an after-hours disco in order to
acquire the right to put up an antenna? Imagine how you would feel if
some federal agency decided to pre-empt the restrictions against things
that *you* **absolutely** didn't want in your neighborhood. There are
always two sided to every issue. Don't get me wrong, I don't like
restrictive covenants, but the US Government has decided to keep its nose
out of private contracts and terms of sale. That is a refreshing change
from the norm, except for the fact that it affects me! ;-).

There's a person named Jack Coles in San Jose, California, who has
predicted a large earthquake before 2PM (PDT, I assume) tomorrow.
The relevance here: he claims he sees RF signals that precede quakes.
He uses spectrum analysers (he said he has several on a fragment of
interview that I cought on KPFA Monday) and the picture of him in
today's SF Chronicle shows a couple of spectrum analysers and a R390
(A), complete with meters, radioactive or not.
There is official skepticism.

As stated previously, BONEX supplies all the bits/article, but not the
PCB's.
I spoke to John Badger of Badger Boards (where I got mine) and he does a
complete kit for 68.00 UK Pounds + 5.00 Pounds for a case (may be too bulky
and increase the postage), undrilled.
The 3 tinned and drilled PCB's are .... RF Board, Video/Sweep board and
Marker (1/10Mhz)/Power Supply board.
The kits contain all active and passive components, i.e everything you
need to get it working. I have asked John to supply the article with kits,
but it would be wise to mention you need the article as well.
Perhaps someone could persuade QST or CQ to republish this article.

WA4FUT asks:-

>Has anyone tried the homebrew plate glass capacitors described in the second
>antenna compendium for use with a loop? These consist of two metal plates
>(one fixed, one moving) separated by a thin sheet of glass. The author claimed
>greater than 10kV breakdown. He used a simple screw drive to move the upper
>plate.
>This linear design has no sliding contacts so it should be low loss.
>
If you only need a small capacitance-swing (single-band antenna?) then why not
fix BOTH the metal plates and simply move the glass plate into the air-gap?
The change in dielectric-constant between >all glass< and >all air< would
probably give a suitable tuning range. I have seen military UHF PA stages
use this method, but with a plate of PTFCE (yes PTFCE - its more rigid
than PTFE) instead of glass.
Having none of the moving-parts 'live' to RF would probably make the
construction much simpler too.

2643. Getting good RF/DC ground from 2nd floor

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-12 11:56:24 UTC
From: eckman@eos1.larc.nasa.gov
Message-ID: <1991Sep12.115624.2981@news.larc.nasa.gov>
Source record: 293812

I am in the process of getting an HF station on the air. My shack is
on the second floor of a house, some distance from any source of good
earth ground. The discussion in the ARRL Radio Amateurs Handbook points
out that such a distance can lead to problems with RF grounding as the
ground cable may be some multiple of 1/2 of the transmitted wavelength.
They suggest an alternative that completely eliminates the DC ground,
but does provide for a reasonable RF ground using a radial system.
Does anyone have experience/suggestions for obtaining a good RF ground
AND a good DC ground for the equipment when the operating location is
on the second (or higher) floor of a house/apartment?
My cold water system, unfortunately, utilizes PVC pipe as far as I can
tell. So, that alternative wouldn't work for me. Thanks for any suggestions.

No, it wasn't because of leakage. It was to prevent you from using the
radio. I had the same experience 15 years ago when I drove to Windsor
Ontario from Detroit. When I crossed the border, the border patrol
sealed
my microphone in a plastic bag so I couldn't operate the radio. They
informed me as such. That was back when I needed a permit to operate
in
your country. I'll have to admit I haven't been up that way since
then.

> the items. I had the following X-Rayed 4 times domestic and 2 times
> international and was only asked to open the briefcase once; that's right
> ONLY OPENED (didn't have to remove a thing), just once!

My experiences duplicate almost exactly what is described above. I have
been taking scanners, portable shortwave radios and HTs on both domestic
and international flights for years. So far I have had more of a
problem getting my camera and film hand checked than I have had getting
electronic equipment through airport security. So far, only in Norfolk,
VA have they even asked me turn turn on any of the radios. It was my
PRO-2004, but they had a 110 VAC outlet nearby, so it wasn't a problem.
My experiences include Dulles and National Airports in DC, Los Angeles,
San Francisco, JFK in New York, Pittsburgh, Chicago, St. Louis,
Cincinnati, Charleston and others in the US. Internnationally I've
carried my radios through Heathrow in London, Paris, Stuttgart,
Copenhagen, Glasgow, Oslo and several small domestic airports in Norway.
The tightest security was in Heathrow, but they only hassled me about
my camera, not my radios. Surprisingly, I didn't have an problems with
customs, either in the US or abroad. Of course I still recommend
carrying proof of ownership with you and reciprocal operating permits
for any ham gear.

2646. How to cure IC-W2 bad TX audio

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-12 13:30:19 UTC
From: benjamin@ee.tut.fi
Message-ID: <1991Sep12.133019.637@cc.tut.fi>
Source record: 293813

A couple of weeks ago I posted an inquiry about bad transmit audio in a IC-W2 handheld. I would like to thank everybody who sent in their response.

Some said their radios work well, one said his doesn't and one told Icom America had repaired similar symptoms in his friend's radio. A later comparison with a healthy unit confirmed that the fault wasn't between the operator's ears...:-)

However, Jukka, OH2BUA, a good friend of mine happened to work me with his brand new IC-2SRE. He had audio characteristics astonishingly similar to my radio. As a result to my complaints he opened his radio and cured the problem. Last Monday I did the same job and here it comes:

--------------------------- W A R N I N G ------------------------------

Servicing your radio by yourself may void the warranty. The author takes no responsibility whatsoever of the possible hassles with warranty codes intended for technically non-experienced radio users.

If you are not a qualified radio service technician on if you are not accustomed to work with extremely miniature surface-mount components, return your radio to the dealer with the following instructions.

--------------------------- W A R N I N G ------------------------------

Radio: IC-W2A/E, IC-2SRA/E, IC-4SRA/E

Trouble: Weak transmit audio, deviation below the specifications, high end of the speech spectrum missing.

Tools needed: A good soldering iron with a sharp tip, desoldering braid, solder, sharp-nosed pliers, small cross-point screwdrivers.

Cure:

1. Open the radio case following the instructions in the owner's manual (p. 45).

2. In radios fitted with the UT-63 board, pull out the board.

3. Unscrew the two small screws holding the tin plate against the bottom ends of the band modules. Pull out the plate.

4. Pull out the band modules.

5. Now you see the microfone fitted to the mother board. It should fit neatly against the inside of the fascia panel. If it doesn't, carry on.

6. Unsolder the microphone leads from the mother board. BE CAREFUL not to overheat the board and the wire insulation.

7. Pull out the microphone and the rubber gasket.

8. Re-install the gasket. Pull in the microphone so that it fits inside the gasket well and press it firmly to the end.

9. Re-solder the mic wires.

10. Install the band modules, the tin plate and don't forget the screws.

11. Replace the rear panel.

12. Tighten the 7 screws.

13. Test the audio response.

(c) OH2BUA and OH3BK, 1991. Unlimited reproduction allowed.

Steel doesn't provide very good shielding from gamma rays. While 2
inches of lead will stop 1/2 of the gamma radiation, if I remember
right, it takes 10 inches of steel to provide equivalent shielding. I
once had one of those glow in the dark divers watches. When I joined
Rickover's nuclear Navy they checked it out with a radiac before
allowinw me into the plant. It was really hot, but the radiation was
beta particles not gamma rays. Needless to say, they wouldn't let me
wear the watch on duty and I didn't want to wear it again anyway.

>
>How are trunked radio systems different from standard repeaters?

A trunked radio system is more like a cellular radio network.

All the repeaters are linked to an exchange and the system has automatic channel selection and direct dialing. You can have a private conversation with another unit or an open-channel "round-table" between several units. Some systems even have access to the public telephone network.

A trunked system usually has several channels at one repeater site.

Usually the main difference to a cellular network is that you don't have hand-over, i.e. when you get to the boundaries of the coverage area of one repeater the QSO ends. the trunked systems tend to be more limited when it comes to the service area of one operator, too.

This reminds me of the ECPA of 1986. It was then that the cellular companies first got congress under their control. There is some belief that somehow unprotected conversations over an otherwise public medium should be private. Personally, I think this is rediculous.

What's more insane, is that since a portion of the cellular band was stolen back from the high end of the old UHF TV band, any sufficiently old TV has the ability to tune cellular calls. Does this make me a criminal for owning such a TV ??

Let's face it, technology has increased at an incredible rate while the average IQ of our statesmen has gone down steadilly.

I thought I read that the R390 was the preferred model because
IT contained the mech filters while the 390A had crystal filters.
Am I mistaken? Also, for those poor souls who have never heard what
a real radio with mechanical filters sounds like, you wouldn't
believe the difference between a Collins mech filter and a "modern"
import crystal filter. Who has the mech filter mods for Icoms?

> The internal construction was somewhat unusual. There are virtually

Unusual, maybe, but if you're used to working on the 75A- series
of receivers, it's easy to get used to. The 75A-s also have
RF amp tuning ganged to this slug table. The tunable front end
works wonders---my 75A-2 is much less susceptable to front-end
overload than my IC-765. Icom take note.

> If you look up the word "anchor" in the dictionary, you'll likely

When I looked it up, I found another Collins product, the 32V-2.
I think mine tips the scale at about 125lb. It's all transformers.

Is the R390/A the RX that's sometimes called "the best HF RX ever
built" or is that the 651J? Whichever is is, I want one. Now if
I can just figure out how to wire it up to that nice Icom
transmitter...

Well, not to really get into why the use of a term like 'sucks' is pejorative, and offensive (and not something one would expect a well trained and socialy constructive Amateur Radio Operator would say) The reason that it 'sucks' would seem to be that there are a lot of people who think that code is a rite of passage that must be shared by ALL people. Some feel that since 'they did it' that others should pay the same price. In general it merely seems to be a form of bigotry one could expect from people who express themselves with terms like it 'sucks'

Give it no thought. The world is full of bigots and loudmouths. Just do unto others as you would have them do unto you, and hope that people like K7UIJ have the opportunity to grow up and become useful members of society.

I recently installed wires (10 guage) and 15 amp fuses in my car.
After a couple of days searching, NAPA Auto Supply was the best source.
They carry these items for connecting trailers, boats, etc. Purchased
a quick-disconnect for the power source there too.

>think this sucks, BTW),

I'm not sure if you object to no-code or CW waivers here. I have no
comment on no code (I have already said my piece on that :-)).

However you need to look MUCH more closely if you think the CW waivers
for handicapped hams is any "giveaway". I have just reviewed the
procedure as part of the VE cerification process and it is certainly no
"easy out" for anyone.

First the test may be modified in any way that is required to allow the
person to take it. Flashing lights, hand signals, sending a word at a
time then responding are only a few of the extremes suggested by the
FCC. They also suggest substituting a sending test (using just about ANY
means to send CW at the required speed).

ONLY if NONE of these can possibly work is a waiver allowed. Then a
physiscian must go over the person's capabilities and the requirements
for CW (there is a special FCC letter to the physician which details
these requirements). Only if there is simply NO way for the person to
take the test can the physician certify a waiver. My impression is that
so long as someone is breathing they should be able to find SOME way to
take the test under these rules! I will admit that I don't know much
about the specific limitations of many handicaps though.

My opinion is that if someone truly is that limited in their physical
capability but has the "guts" and persistance to become a ham anyway
then a waiver of ONLY the CW is a very reasonable thing to do.

>it occurred to me to wonder if anyone has
>gathered in one place or reference all the changes in privileges/freq
>allowances/exam requirements/logging requirements/etc for the amateur
>service from, say, the establishment of the Federal Radio Commission

>10 guage wire and an 8 or 10 amp fuse. A 100 watt HF radio would use
>even larger components.

Most auto parts places sell what they call "heavy duty" fuse holders. They
are the in-line type, use ATO fuses (the flat blade-type fuses), and have
(usually) 12 gauge wire on them. These are OK, but personally I would
suggest using something with beefier leads if you're drawing more than
20 amps, especially if whatever mode you're using is high duty cycle. 20
amps is usually the cutoff point for 12 gauge wire when insulated and
bundled - it's sort of a judgement call on your part as to what gauge
you think is best for safety reasons as well as voltage drop.

I run about 220 watts on VHF SSB from the car; between the rig and the
amp it draws close to 35 amps. The fuse holder I use is an ATC type.
ATC is also called "MAXI-FUSE" - it looks like an ATO fuse except about
3 or 4 times the size. The fuses are available in 20 to 60 amp values.
The fuse holder has 6 gauge wire on it, and a weatherproof boot that
fits over the fuse. The price isn't too unreasonable - about $7 each.
I bought mine at a connector supply house in Denver (GC Connector?). I've
been told these types of holders are often used in RV's, so you might
be able to find them at an RV place. The fuses themselves can be found
at just about any auto parts place (fuses cost about $1 - a little steep).

BTW, I've found that finding heavy gauge fine-strand wire is a bit of
a pain. The brand I found that is about the best available is
S.I.W. AMP KING - it comes in 12, 10, 8, 6, and 4 gauge. It is
VERY flexible (strands look like about 28 gauge) so it's nice for
running to the equipment. You can probably find somebody that
stocks wire from S.I.W. without too much of a problem, or you can
get it from Gateway Electronics (stores in various places around
the U.S. - I got mine from the Denver store).

73 and good mobile dxing.

Not only havfe I seen one, but I have one. Unfortunately, I have never seen a manual for it and don't know how to make up the wiring harness that connects them together. That means that although I can use it for SSB reception, I don't get any of the AFC (which is as mechanical as the tuning) functionality. It appears to add yet another stage of conversion and greatly improves the already remarkable performance.

|> I've got one of the
|> original service manuals and the radio alignment procedure is about
|> 50% mechanical, 50% electrical.

Now that's something I can really use. Mine is long overdue for re-calibration.

I would never even consider parting with mine. They are still great radios.

I have an Alinco 110 I use on packet. It works very well.

Except the display is back-lit LCD, and the bulbs burn out (and
are a royal pain to replace). Unless they've changed the display
I'd recommend against buying one. Shame, RF-wise I like the 110, but
what good is it if you can't tell what freq it's on :-)

If someone's got a fix for the bulb-burning out problem, I'd
love to hear about it..

Source record: 293821

PRESS RELEASE # 3 (Sept 12. 1991)

ZA GROUP SEEN AT THE ZURICH AIRPORT

The initial three-man team of N7NG, OH1RY, and OH2BH was seen at the Zurich airport on Thursday, September 12, 1991, meeting up with their German and Swiss partners for a last minute planning session before boarding a Swissair flight at 1:00 pm... destination Tirana, Albania.

Some interesting items were noted before their departure:

- This initial group and the following sub-groups are traveling to Albania without a visa. A special arrangement has been provided by the Albanian government to facilitate this multi-national team.

- Eight (8) complete stations with multiple beams and amps -- all donated to the Albanians -- have arrived safely in Tirana and are in storage at the PTT facilities.

- Other operating areas such as the low bands, six meters, and RTTY have been discussed with the Albanian authorities and they seem to have no objections. The main goal of providing at least one initial contact with every needy DXer will be given preference over multi-band requests.

- Establishing amateur radio in Albania did not happen accidentally, but is the result of a two-year project which culminated in the signing of a well defined and detailed plan in early 1991. The initial work has included several visits by the Albanians to Finland as well as several visits by OH2BH to Albania.

- During the opening day of Amateur Radio in Albania, Sept. 16, 1991, the Albanian President will be in Finland signing, for Albania, the well known treaty for European Security and Arms Reduction.

- Following the initial training course, the ARI (the Italian Amateur Radio Society) will be inviting the course participants to Italy for further training.

More news will be transmitted soon from Tirana.

Based on how the DSP connects to my TS-950SD, I do not think it is possible. There are extra connectors that give an IF to the DSP.

If memory serves (you know what they say about getting older), the R-392 was the 24 volt version of the R-390. No inverter/dynamotor/etc. was used -- they ran 24V on both the filaments and the PLATES! The audio output tube was a real hog to get enough current to flow with only a 24v supply.

Fair Radio had a sale on them for $75 each many years ago. I wish I'd bought one. They were real easy to convert to solid state because you could do it one stage at a time.

You can get the complete Kenwood files on the Kenwood BBS at
213-761-8284. That's where I got mine, and this includes some mods and a
lot of service bulletins. There's a zipped file including 'em all, or you
can just download which one you want. It supports 2400 baud last time I
called.

2668. R-390 and R-392

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-12 19:56:28 UTC
From: 5346P%NAVPGS.BITNET@cornellc.cit.cornell.edu
Message-ID: <9109122004.AA01806@ucsd.edu>
Source record: 293635

Just to clear up some of the R-39X confusion:

The 390 is the version with LC filters, the 390A had the mechanical filters. The 390 is a little more sensitive, the 390A has *great* selectivity. Both are excellent receivers......

The 392 is a 24-28 volt "clone" for vehicular use -- by which I mean a platform on the back of a jeep, not a comm van on the back of a 2 or 5 ton truck. The case is made of solid aluminum with NO air communication with the outside world. The tubes are hard to find in some cases, but the 392 is much easier to convert to solid state than the 390. Like the plain 390, the 392 uses LC filters but I think it only had 4 bandwidths (1,2,4,8 KHz). Power consumption is only about 75 watts total (3 amps at 24 volts or thereabouts) which is about the same as a 390 with the crystal oven turned off.

I've owned both and loved them.

2670. Re: MAXON's Ear Microphone

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-12 21:00:42 UTC
From: 2543byrnek@vms.csd.mu.edu
Message-ID: <0094E891.8F414B20@vms.csd.mu.edu>
Source record: 293631

I have an Alinco DJ-100 and one of the optional gizmos is an ear mic similar
to the Maxon type. It is not a VOX, there is a PTT button on the cord.
I can't say for sure, but I believe that it runs about $60.

Technicals:

Plug: submini STEREO (if anyone can get these plugs, please email me!)
Pin-out: Tip - Earphone
Ring - Mic
Sleeve - Ground

The tansmitter is keyed whenever the mic line is shorted to ground, or if
the mic line is connected to a mic, with the ground on the other side.
This way, they just put a SPST momentary switch on the mic line for PTT.

```
ear phone mic
| | | |
| +-------| |-----------+ |
| |_| |
| / PTT button
| ~~~--------------/
+-----------O
```

Alinco DJ-100 / DJ-120
Speaker-Mic plug

(hey, there's only so much you can do with ASCII characters!)

Keep in mind, that in the case of ear-mics, both the mic and ear lines
are put on the same element. The state of the PTT selects if it will act as
a speaker or a mic.

Note: If you hook both the mic and the speaker lines together, you may have to
put some resisters in there (on the mic line) to keep it from keying (IE: kee
p the radio from seeing the earphone as a short.

The better way to do this would be to get a switch that goes from one
connection to another when you push it. (but still return to the original
position)

Source record: 293636

I've recently acquired a DR110T for the sole purpose of using it on packet. Their propaganda advertises it as "true FM" which may, or may not help data integrity. I've been using it in that service and it is working just fine.
Prior to "going data," I used it for a few weeks in place of my Kenwood TM231A for a mobile rig. Subjectively, it appeared to be much more prone to intermod in areas of high RF pollution. The microphone is not ergonomically desinged. I got cramps in my chubby little fingers after a few minutes of motor mouthing on the DX repeater.
End of review. Good luck.

2673. Cable/mast interfere with V. Yagi??

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-12 22:17:49 UTC
From: goris@conan.HP.COM
Message-ID: <56500015@conan.HP.COM>
Source record: 293647

I have a practical question concerning vertically polarized yagis (in this case 2M and 70 cm):

If you mount a verticaly polarized beam antenna using a conductive mast, how much does the mast effect the pattern and forward gain of the antenna. Presume that the mast is not a multiple of 1/4 wave, and that it is several inches from any of the elements, but still in the plane of the elements. Also assume that we're talking about a 4-element or larger beam --- maybe as high as 8-10 elements.

Suppose I have a NON-conducting mast. Now I need to get the cable away from the antenna without interfering with the field. If I just run the cable down the mast, HOW MUCH will it effect the forward gain, again assume that I don't run it too close to the elements, etc., etc (unless there is some reason this would help the pattern). If I run the cable out the back, behind the reflector (cable looks like an extension out of the back of the boom), and then drop it to the ground, should this have less effect on the pattern/gain than dropping the cable in the middle of the boom/parallel to the elements? How many dB of difference will this make?

These topics do not seem to be covered well in the antenna books I have, so they must be either (a) not commonly encountered (hard to believe, given that 2M is usually vertically polarized) , or (b), the effect is small enough that nobody cares.

My apologies to Mr. Gefaell (and others who were offended) -- I should have said "stinks" or "is reprehensible" or "flies in the face of the dignity of humankind" etc. I was typing fast and chose the shortest word without respect to connotations. Sorry.

Now then: Dube and Jon deserve a longer explanation. I am not saying "I did, it, therefore you should". Nor am I talking about a "right of passage" (though at one time Morse code was considered such by many).

First of all, I am blind. I cannot pass judgment ethically on the efficacy of the high-speed code waiver for other disabilities than blindness (though I think many with other disabilities might agree with what I shall say below). In the case of the blind, at least, code poses no significant barrier. To allow the waiver for the blind is to deny them one of the outstanding benefits of ham radio -- the gift of treating them on a basis of absolute equality with their fellow (nonhandicapped) hams. I am proud of the fact that I got my licenses the same way everyone else did. To have given me a waiver says, in effect, that I am not expected to perform to the same

standards as others -- in effect, to say that I am inferior. The blind, at least, have been struggling for thousands of years to break the bonds of supposed inferiority. We don't need laws and regulations which enforce false stereotypes.

In other words, one of the virtues of amateur radio was/is that it is (and always has been) a place where the disabled were treated with dignity and on a basis of equality. I, for one (and most blind hams I know), don't want this attitude to be eroded. Hence, my views on the waiver, at least as far as the blind are concerned.

Be assured that I do not (and cannot) speak for other disabilities.

It might also interest the Net that at its 1991 convention, the National Federation of the Blind passed a resolution opposed to the waiver as it affects the blind.

'Nuff said and my apologies for any flames that have ensued or that will.

This really oughtta go to "rec.radio.amateur.policy" but thought Dube deserved a thoughtful answer in case he doesn't read that group.

>Personally, I think this is rediculous.

This is exactly what neds to be noted. In 1986 the first breach of the rights
of folks who wish to passively monitor the airwaves that impinge on their
bodies happened. (The camel has arrived on the scene).

Now in 1991, the radio grabbers are ready for their second wave, HR1674.
(The nose of the camel is in the tent).

The next thing that will happen a few more years down the road will
be the banning of radios capable of receiving utility and public
service broadcasts. (We will have the whole camel in the tent by then).

It is important to realize that the radio grabbers do their grabbing a little
bit at a time. Their strategy is precisely the same as the gun control folks,
they are just a few years behind. This insanity must be stopped NOW!

>tell. So, that alternative wouldn't work for me. Thanks for any suggestions.

In theory, if you run a balanced antenna, you don't need a ground for RF at all. In practice, unless you operate from a Zeppelin, effects of surrounding structures will upset the balance of your antenna and you should use a good RF ground.

When you are a long way from a true earth ground, such as your case, you need to provide a ground path that is low impedance at every frequency that you may operate, and at frequencies where you *don't* want to operate. Since you are dealing with RF, you need to use ground conductors that have a large skin effect such as copper braid or wide copper flashing strap. This will lower the impedance of the ground path. But being far from ground adds another complication, your ground strap may be quarterwave resonant at a given frequency and act as an effective open circuit. The way around this is to use *several* ground leads, each of a different length, connecting the equipment to the ground. This way at least one of the straps will not be resonant at a given frequency and will short the ones that are.

Use of an artificial ground, a tuner for your ground lead, that makes the lead appear to be halfwave resonant at your operating frequency will help with fundamental frequency grounding, but will not be a ground for spurious products outside the fundamental. Thus you may still have harmonic currents circulating on your equipment.

For RF and lightning protection grounding, you want the ground lead to be large and very straight. Sharp bends will introduce inductance that will impair the effectiveness of the ground. For safety grounding the only concern is that the conductor be heavy enough to reliably trip the breaker if a fault should occur.

In some special cases it is desirable *not* to have an RF ground, but a safety ground is always required. In these cases use a choke in the safety ground lead or use the inner conductor of a piece of coax with the braid connected only at one end. This forms a waveguide beyond cutoff filter.

|>

As is usually the case with military gear, there were more than one type of Sideband Adapter.

Mine has more tubes than that just in the power supply. It is almost twice the size of the R390 itself, and weighs easily twice as much. It offers a mechanical AFC as well as sideband detection. If you think the R390 was stable after warm-up, hang this sucker on and you can watch as it tunes itself to keep on frequency.

Boy would I love to have 2 of these hooked up to a diversity unit like we used for RTTY in the good old days. :-)

]
]Yes, but would the ham be willing to give up the right to restrict their
]neighbors from tending cows or operating an after-hours disco in order to
^^^^^^^^^^^^- yes - see below. After-hours disco is a zoning
issue, not a CC&R issue - as is raising cattle.

]acquire the right to put up an antenna? Imagine how you would feel if
]some federal agency decided to pre-empt the restrictions against things
]that *you* **absolutely** didn't want in your neighborhood. There are
]always two sided to every issue. Don't get me wrong, I don't like
]restrictive covenants, but the US Government has decided to keep its nose
]out of private contracts and terms of sale. That is a refreshing change
]from the norm, except for the fact that it affects me! ;-).

I don't think you are reading very carefully here. I did NOT advocate
federal intervention in CC&R's. I did suggest that if everyplace you
try to buy has identical CC&R's that restrict ham radio, then the
private contracts are not voluntary, in which case those CC&R's may
be held invalid. I think you would agree that there should be diversity
in CC&R's. In most cases that I have seen, the CC&R's are VERY restrictive -
basically prohibitting any alteration in the exterior appearance of
a property without homeowner association permission. In addition, a very
wide range of things are absolutely prohibitted.

If people want to live in tightly controlled neighborhoods, that's fine with me. However, when EVERY new development has these extreme restrictions, then choice has been removed - and I think that is very wrong.

Why should I be forced to either live in an old, run-down, crime ridden neighborhood, or move 30 miles from downtown, in order to put up a beam?

I currently live in a neighborhood with strong, and consistently enforced CC&R's. I ended up here after TWO YEARS of searching for a suitable home that did not have these restrictions. This particular home is situated in such a way that I can put up a beam at 16' without it being visible to neighbors, and I have done so. I would love to put it at 40', but I recognize that in this neighborhood of expensive homes located in a semi-rural area of great natural beauty, this would not be aesthetically acceptible to my neighbors. However, it would have been nice to have some choice in the matter, and to be able to chose a place where I have less control over my neighbors' property in return for them have less control over mine! One property that I considered had cattle being raised next door, and yet it was still restricted from having any outdoor antennae!

CC&R's are strong today because people have so much of their net worth invested in their homes that they are fearful of any neighborhood change that would affect the value. Also, an awful lot of people in today's society are intolerant of any deviance from the norm. While I understand their feelings, I don't think a universal application of restrictive CC&R's, with the resultant forced conformity of everyone, is a very healthy or desirable phenomenon. And, from a LEGAL point of view, if these CC&R's become universal, they take on the aspect of an involuntary contract, at which point they can be challenged. A private contract is not valid if one party signed under duress!

I just received my Maxon ear-mics in the mail. Since I didn't
have the article before ordering I did not get the cables
with the nice connector on it to connect to the ear piece.
So as a word of warning for those who might be interested,

you might want to order the cable at the same time and save time
and shipping costs.

coil cable to ear-mic: #504-460 @ $4.20 each plus the $3.00
shipping. (This cable is for the 49-F5 which does not have
a plug on the radio side - only wire ends.)

I am all for keeping government out of private contracts, but here in California (Land of the Lawyer), it is impossible to purchase a new home that does not have CC&R's on the house. So your only choice is to purchase a home that is at least 25 years old. So is that a choice? I think not. I am fortunate that I was able to buy a new home and beat the CC&R's that my development had... Not sure if everyone can do this. I also had no choice since I was already in the house when I got active in Ham radio again.

Right now I think California home buyers might have a chance to get CC&R removed from the purchase of a new home since the recession has slowed new home sales... But this will not last... I already see indications that the crazy California home market is starting up again :-(

>My apologies to Mr. Gefaell (and others who were offended) -- I should have
>said "stinks" or "is reprehensible" or "flies in the face of the dignity of
>humankind" etc. I was typing fast and chose the shortest word without
>respect to connotations. Sorry.

Yeah, I can certainly understand your explanation. I also unhesitatingly accept your apology as well. HOWEVER, I'd like to briefly point out that NOT THINKING about something doesn't justify or excuse it. Often it is the act of THINKING conciously about how we effect others that is the act of decency which is required in society.

>Now then: Dube and Jon deserve a longer explanation. I am not saying "I did,
>it, therefore you should". Nor am I talking about a "right of passage"
>(though at one time Morse code was considered such by many).

It's funny, but among the distractors in the first part of element 2, the novice writtene exam, for the question 'What is the purpose of the Amateur Radio Service' the phrase 'The preservation of historical Operating Techniques' or something similar is included. As a Distractor, it is intended to strenghten the knowledge and understanding that this is NOT a requirment, nor a purpose for the Amateur Radio Service.

I suppose the idea one should get is that while some people like to do things for the joy they take in it, not all persons should have to enjoy the same things. If there was a technical, or compelling reason why people should have to be skilled in the sending and/or receiving of the Morse code, then it would still be a requirement. As it is demonstrably NOT compelling, it is NOT a requirement. It is now, given current technology a mode for the ENJOYMENT of those given to such things.

>First of all, I am blind. I cannot pass judgment ethically on the efficacy
>of the high-speed code waiver for other disabilities than blindness (though
>I think many with other disabilities might agree with what I shall say
>below). In the case of the blind, at least, code poses no significant
>barrier.

What you are saying is that blindness, itself, is not a limitation to the ability to send and/or receive the Morse code. I, and I'm sure others agree, think that this is great. Blindness, as with many other diferences in ability, can be challenging, and the lack of ability to do certain things is frustrating and dificult. IT is great that the ability to send and/or receive the Morse code is not among those areas denied to persons with visual challenges.

To allow the waiver for the blind is to deny them one of the
>outstanding benefits of ham radio -- the gift of treating them on a basis of
>absolute equality with their fellow (nonhandicapped) hams. I am proud of the
>fact that I got my licenses the same way everyone else did. To have given me
>a waiver says, in effect, that I am not expected to perform to the same
>standards as others -- in effect, to say that I am inferior.

Whoa there! In the first case, it is a WAIVER, not a denial. ANYONE is welcome to take the tests just like anyone else, no stopping after characters or word groups, full speed, audible, etc... There is NO regulation which phrohibits an diferently abled person from the 'standard form' of the examinations, both written and code.

Secondly, *YOU* may be quite proud to have taken the examinations the 'standard way' BUT, *YOU* have no right to demand that ALL diferently abled persons must subscribe to the same self and world view that you subscribe to. To some, nay MANY people, there are OTHER challenges that they wish to focus on which do not include taking the Amateur Radio Examinations in the standard form. Among these people are those who would like to participate in the Amateur Radio Service. For these people, the accomodation given them in light of their diferent abilities allow them to participate without an inordinate amount of challenge.

>The blind, at
>least, have been struggling for thousands of years to break the bonds of
>supposed inferiority. We don't need laws and regulations which enforce false
>stereotypes.

Accomodating persons of diferent ability, when those accomodations do not make a tangible diference in their qualifications, or skills is not enforcing stereotypes (which are, by definition, false.) I'll leave specific discussion of stereotyping and bias/discrimination for other newsgroups.

>In other words, one of the virtues of amateur radio was/is that it is (and
>always has been) a place where the disabled were treated with dignity and on
>a basis of equality. I, for one (and most blind hams I know), don't want
>this attitude to be eroded. Hence, my views on the waiver, at least as far
>as the blind are concerned.
>Be assured that I do not (and cannot) speak for other disabilities.
>It might also interest the Net that at its 1991 convention, the National
>Federation of the Blind passed a resolution opposed to the waiver as it
>affects the blind.

It is most unfortunate that any individual, or group would deign to speak out to deny accomodation for people. As I pointed out before, not all persons have the same goals or desires as you do. For some people, there are other challenges which supersede that of learning high speed Morse code.

These people may be undertaking challenges that would leave you, or me broken. They may be undertaking challenges which would be trivial for us, but for them have great importance and distinction. We should, I feel, allow these people access to fields like Amateur Radio as freely as possible, and high speed Morse code does not seem like a necessary barrier.

Of course, I must not be alone in these thoughts, after all, it is THE LAW.

>'Nuff said and my apologies for any flames that have ensued or that will.
>This really oughtta go to "rec.radio.amateur.policy" but thought Dube
>deserved a thoughtful answer in case he doesn't read that group.

I don't know if Dube got your reply, but I obviously did. I appreciate the time and effort you put into a thoughtful and cogent reply. Please understand that I appreciate your point of view, and I hope you appreciate mine :)

I'm pretty sure there WAS a 19" rack-mount (about 3.5" of rack space)
product detector SSB adapter as a military gadget.
Looked something like the RTTY adapter
that was also often used with the R-390. I think these both had
CV-xxxx/URR designations (CV-3920/URR ??) but can't remember more
than that from 20 years ago when I worked for the Naval Electronic
Systems Test & Evaluation Facility (boy, did we have lots of good
toys to play with).

From: geb@dsl.pitt.edu
Message-ID: <11753@pitt.UUCP>
Source record: 293657

Since I am a codeless technician (although I passed the
General part of the theory test), I haven't taken a code test, but
my understanding was that one only has to demonstrate the ability
to understand the code, not send it. Certainly sending at high speed
could be difficult for some persons, such as those
with cerebral palsy, who could benefit greatly from ham radio.
But what sort of handicap keeps someone from understanding code
that does not also hinder other sorts of communication as well?
Are there deaf hams? I could understand waiving code for them,
as they could still use RTTY and AMTOR quite usefully. What
sorts of handicaps have had the code waived in the experience
of the VEs out there?

If I could write the regs, I would have the code test only for
those who wished to use the CW part of the bands. I can't see
its relevance for SSB, AM, Amtor, RTTY, etc., etc. I would hope
WARC 92 may see some worldwide changes in these rules, as CQ
magazine suggested a few months ago.

I'm sure that was just an off-hand remark, but are you implying that more experienced hams can't cut it at fast CW? My father in law is 81 years old, has been an Amateur Extra for many years, and I've heard some pretty good CW coming out of his rig.

Oh, BTW, I passed my novice exam on Aug 18, and am "patiently" :-) waiting for my license. In the meantime, I'm studying the Technician material (I got "Now You're Talking" per net recommendation, and like it pretty well). I've also gotten Morse Tutor for the PC, and have worked up to about 8-10 WPM; hopefully, I'll be able to go for a General class license early next year, if not sooner. My father in law is going to help me look for a good, cheap, used rig (hopefully those aren't totally contradictory adjectives) in a couple weeks. Oh well, enough rambling for now.

From: paulz@hpspdla.spd.HP.COM
Message-ID: <32920027@hpspdla.spd.HP.COM>
Source record: 293670

Thanks for the info.
I guess I got off to a false start by taking the set of leads with in-line fuse holders that came with the radio. That uses 3AG size fuses, whereas all of the auto people now use the blade type.

email also suggested Radio Shack. However their in-line fuse holders are only meant for wire up to 14 (or is it 12) guage. Now, 14 guage wire will certainly carry 10 amps with plenty of margin as far as the heating of the wire and accompanying insulation. However in a mobile installation where there are only 12 volts available, a drop of of a half a volt is an important consideration.

2694. Super long play RECORDERS

Newsgroup: rec.radio.amateur.misc

In every issue of Popular Communications, there is an ad for a super long play recorder from AMC Sales Inc. It uses a "modified" Panasonic Slimline cassette recorder to stretch a one hour tape into six hours. My question is, how do they modify it? Is it a simple mod, such as putting a different motor in it? I currently have a Radio Shack CTR-85 voice actuated recorder that I would like to modify in this manner and I am curious as to what all it involves. I need specifics. Anyone done this?

David

>stocks wire from S.I.W. without too much of a problem, or you can
>get it from Gateway Electronics (stores in various places around
>the U.S. - I got mine from the Denver store).

This thread, and the power connector one before it, finally got me out shopping for parts to correctly wire up my mobiles...haven't been able to find the ATC fuses and holders Jeff describes above, they sound like just the thing for the job....

As far as the wire goes, I found something interesting while I was out looking...seems that the car audio industry has decided to make some $$$ off the guys that just have to have 1.5kW of raw audio power in their cars... for sale at a local store in the audio dept was a power wiring kit consisting of 20' 8 ga Cu wire, with a 3AG type (but substantially larger, don't recall the designation) inline fuseholder. Total cost: $39.00! They were also selling just the fuseholder for $15.00, so that prices the wire out at just over $1.00/ft.....never realized copper prices were so high :-).

Maybe I should go into business selling these guys omenmeters and joltmeters, so they can tune their power feeds for minimum SWRs :-) :-)

Does anyone know of a source of ARRL bulletins for 1991. I was
keeping them on a PBBS but they got deleated. Would like to
recover the set for this year if possible. thank you for any help.

2697. NASA frequencies for Shuttle mission

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-13 19:20:01 UTC
From: hhg9751@tamsun.TAMU.EDU
Message-ID: <3470@tamsun.TAMU.EDU>
Source record: 293666

Not to long ago there was a posting which outlined NASA
frequencies used in conjunction with the Shuttle missions.
If someone still has a copy could they please repost it
or e-mail a copy? Thanks!

Question -- re: sending mail to callbook-help@sat.datapoint.com.
Do we really need special PATH setup to get to above destination.

Could you give more detailed info on how to get to
"sat.datapoint.com"?

Thanks in advance -- Bob. k9cgd
Any help appreciated.

2699. A complete list of morse code

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-13 19:42:32 UTC
From: kkim@plains.NoDak.edu
Message-ID: <11932@plains.NoDak.edu>
Source record: 293668

I wonder if there is an ftp-able COMPLETE list of morse code for
letters, other special characters, and prosigns. My ARRL book does not
have a list. The Novice test requires only a few special characters and
prosigns. I know those, but not the others.

I also noticed that some code is expressed as either a prosign or
a special character (e.g., =). I hope the list explains this too.

Thanks.

In Grove catalog. It hooks between scanner and antenna.

Do such things work? I mean, is it really good or does it just
add very little listening POWER. I'm trying to pull in
some low power 460 Mhz range stuff and I'm wondering if this
would be worth trying.

Thanksd

2702. Help with Apartment Antenna

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-13 20:38:07 UTC
From: isis@pyramid.pyramid.com
Message-ID: <169719@pyramid.pyramid.com>
Source record: 293672

I have currently run out of ideas to fix a problem that I
have with my apartment antenna. I have a B&W AP10 40 to
2m antenna hooked to a Kenwood TS-430S transceiver. Now
for the problem.

I find that I cannot get the antenna to run full power
(100 watts). I get real bad RF bite after about 60 watts
or so. The rig will blink off (shuts down) when trying
to do so. I have the rig hooked to a good coldwater
ground. The ground does help, but only so much. The
SWR I can get to match 1:1 or very close to that. I have
even tried making an RF choke with the coax.

My dad has run this antenna with his TS-530S (tube finals)
and had no problems. He even got some DX with it. I
have had only one contact on 40m with it and they were
less than 100 miles and had trouble copying anything.

Does anybody have any hints, cures, ideas, or anything
to help me get unstuck. Maybe I should just yell louder
out the window :)).

Thanks. 73

TVS701-C. Controls a repeater and single link. Link control can also be used to control an autopatch (not included). Fully remotely programmable. Designed for inaccessible locations - hence is very reliable and has watchdog circuitry and software to assured continued functioning after power disturbances. Provides 4 channel A/D with .5% accuracy with telemetry by morse code. Has three tiers of priviledges, with all passwords but the highest level programmable remotely using the highest level. Has four spare digital inputs, with telemetry and 2 alarms. Has four spare remote controllable digital outputs. Analog limit alarm is also provided (to detect low battery voltage, etc).

Comes on 3.5x5.25 inch card. Uses MC68705R3 processor. Parameters and call sign stored in EEPROM. Uses 120ma at 12V (but will run from about 8V up to 15V).

Approx 120 are in use by hams and commercial users. Only one has been returned due to a failure (other than those caused by lightning strikes, and one fumble fingered customer who shorted his out). Many are in very inaccessible sites (such as Navajo Mt, Utah). Also used by the Arizona National Guard for their VHF tactical links. Originially developed for the Northlink Association by NJ7E.

$190.00 from yours truly.

[Sorry 'bout the commercial, but he did ask, after all :-)]

2705. Morse Code Testing (was FCC Service Regs)

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-13 22:32:48 UTC
From: freeman@watsun.cc.columbia.EDU
Message-ID: <CMM.0.90.0.684801168.freeman@watsun.cc.columbia.edu>
Source record: 293676

I feel that one more comment is in order and then (barring unforeseen
circumstances), I will refrain from commenting further upon the matter
of code tests and the handicapped -- specefically, the blind. The
question is not whether code tests are relevant but rather whether they
are required for a given class of license and, given that a code test
is required, whether or not it poses a hardship for a blind license
applicant and what sort of message a waiver of the code test sends to
the prospective licensee and to the general public about his abilities
and those of the blind in general (or the lack thereof).
Bright-eyed suggestion: let's go to Hampolicy
(rec.radio.amateur.policy) to continue this.
Cheers!

Per the rules, I have usally ben prohibited from transmitting (or receiving) with radio gear on commercial aircraft. However, back in 1974 or so, I carried a TR22C on a flight from Denver to Portland, ORegon and requested that I be allowed to operate it during the flight. After showing the stewardess how to make the radio transmit, I handed it to her to take to the captain; she brought it back and said "go ahead!". So I worked simplex and heard fifteen repeaters at a time (whenever I hit the mike button) from Denver to PDX.

I've been asked to turn a HT on a few times at airports but have never had any other trouble. Now my long, white, fiberglass cane -- that's another story (it doesn't make the detectors beep but it's like pulling hens' teeth to convince airport personnel of same).

And you should have seen security people when I once carried a metal gavel in my briefcase on a flight from Portland to Seattle! :-) :-)

If you are interested in a slight amount "homebrewing", I'm working on getting the most recent version of "cw" from a friend of mine and sending it to someone here on the net who has promised to make it "ftp-able". I also plan to send it to comp.binaries.ibm.pc as soon as I convert it to zoo (after I get it, of course!).

It uses the PC (sorry, non-pc folks!) to send and receive morse code. You need some kind of interface to the pc - I've designed one that should work better than a simple 741 wired as a comparator... Basically an active filter followed by a comparator, followed by a 555 set up as a pulse extender (you need a high during the entire time of the tone). Anyway, it will cost about $10 for parts, plus $10 for misc stuff that always comes up :-) Plus the computer :-)

Seems to work relatively well.

> ^^^^^^^^^^^^- yes - see below. After-hours disco is a zoning
>issue, not a CC&R issue - as is raising cattle.

ANYTHING can be a CC&R issue, even if it also covered by zoning. In my town there were some subdivisions with CC&Rs prohibiting raising poultry (I lived in one), prohibiting motorcycles, etc. The only things you can't enforce by CC&R are discrimination restrictions (i.e. "no blacks"). Whether or not the neighbors will take action depends on the neighbors and the local owners' association (if any). CC&Rs are civil matters, between the owners. A local jurisdiction (town) has no standing in such matters and can neither help you nor prevent you from violating the CC&R, so long as it is not also covered by ordinance.

I have in my possession a substantial number of IRCs from UA3DK's recent Vietnam DX-pedition (it's a rather long story ... :-)) He would like help turning them into hard currency to help fund a visit to the States and/or another DX-pedition.

If anyone is interested in buying some, please send me e-mail and I'll give you details.

Of course, they'll be sold at less than the 95-cent face value :-)

Note: I personally will not be taking any money out of this. Although I dislike using the net for financial transactions, I feel even more strongly for the situation of our Soviet colleagues and their difficulty getting currency that is worth anything outside their country.

Thanks!

2714. IC-W2A extended receive?

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-14 02:47:04 UTC
From: crisp@mips.com
Message-ID: <8261@spim.mips.COM>
Source record: 293583

I heard that the Icom IC-W2A had extended receive capability that
effectively allowed it to cover most of the range that the IC-R1
handheld scanner does. My IC-W2A's manual has no mention
of extended receive capability other than as follows:

receive coverage: 136-174mhz, 440-450mhz

Does anyone know if the rumor I heard was true or knows of any
mod or undocumented keystroke sequence that will increase the
operating range of the IC-W2A?

Source record: 293599

Well, the subject is fairly explanatory. Can anyone
tell me if DOVE is speaking it's messages of peace yet,
and if so, is it still on 145.825? If not, when is it
going to start??!!

Sean

In Info-Hams #665, Jeff Miller NH6ZW wrote:

>Maybe I should go into business selling these guys omenmeters and joltmeters,
>so they can tune their power feeds for minimum SWRs :-) :-)

I had a salesman tell me one day that I just had to have a special cable that had as a core, a bunch of 32 gauge wires, surrounded by a bunch of 24 gauge wires, in turn wrapped by a dozen 16 gauge conductors, because the "higher" frequencies travel at faster velocites than "lower" frequencies on thick wires. And furthermore, higher frequencies "like" to travel on smaller wire where they travel at slower velocities but lower frequencies prefer thicker wire. Therefore, the multiple gauge conductor (carefully researched to get the velocites exactly compensated) insured that the various frequencies would be retarded properly thus preventing highs arriving at the speakers out of phase with the lows. Gosh! 8-{ In fact, the wire gauges worked out as being exactly the right diameters needed because the guy that picked the AWG sizes was trying to address this very problem. It was just that stereo gear wasn't good enough (until digital) to make the "effect" become noticable. Shucks...

Now taking that logic a little further, maybe the same technology should be extended to the power feed wiring because I've been shown convincing evidence (by an audio salesman) that "bigger" amperes travel faster on big wire and "smaller" amperes travel faster on small wire. Since the power is going to be drawn at different speeds from the battery depending on your volume control setting, it should be "compensated" for... Gee whiz...

I wish this was April 1st.

I'm not kidding. Some audio salepeople have told me this straight faced.

Radio SHack has some clamp-on ferrites. Try them right next to the
phone instrument.

Are they cheap $10 phones? The older "500" set (or "2500" if touchtone)
was not too sensitive. the newer ones are.

Talk to the local AM station. One local 50kw outlet (KRLA) has lots of
problems with local phones and recording studios - and they have developed
answers. I know about this from a recent article in the LA Times. They
also had an article on KALI, a local 10kw outlet with similar problems.
Maybe a SASE to the chief engineers would be appropriate. I haven't talked
to either chief engineer so you're on your own.

I have been listening to arguments over why code should be required at all for amateur radio, and have a comment. Amateur radio has been a fraternal organization of sorts through the years. Much of that fraternal spirit of helping each other and so forth comes through. One particular aspect reminds me of a painful experience in my past with a college fraternity.

The practice to which I am referring is called hazing. It is a practice which has been forbidden for many years by laws at various levels, yet it continues. Hazing, for those who have not experienced it, is a practice of putting aspiring members through a form of torture. This torture is either of a physical nature or a phsychological one. In my case it was the latter, and led to a rather painful several months of recovery. I learned alot about the people I thought I wanted as "brothers" and decided against the whole affair.

The point is this: the reason for subjecting "pledges" (aspiring members) through this practice of hazing is "I had to go through it, so you will too if you want to be a member." This is precisely the argument which many folks are using to defend code. This is NEVER a good enough argument for any such thing. My father had to learn to use a slide rule, since calculators were not available in that day. Should I have had to use one as well, despite calculators?

I have heard the arguments about marginal conditions and need for code and all that, and yes, I have learned code and all. I don't buy the marginal conditions argument. Any decent amount of advance planning will render more than sufficient voice capability on most bands.

Think about your REAL reasons for wanting the code requirement kept, and for wanting to keep people with disabilities from receiving a waiver. Think about whether your reasons are really hazing.

Message-ID: <m0kLYss-00008fC@juts.ccc.amdahl.com>
Source record: 293596

This means the rig is not at RF earth potential, I used to have this
problem at my old QTH with the same connection to a central heating pipe...
PA taking off and RF bites.
At the new QTH, I have used 1/4 wavelength counterpoises for 80/20/15m,
the recommendation is to connect one for each band though. I have run up to
200W with no problems. I have them connected to the Tuning Unit frame and
strung around the house under the carpets upstairs.
Another suggestion is the MFJ ARTIFICIAL GROUND that allows you to
tune a random length of wire as an effective ground.
With these methods, SAFETY **** use insulated wire and insulate the ends
just in case anyone should come into contact accidentally.
Hope this helps.

> much does the mast effect the pattern and forward gain of the antenna.

There is an effect. The longer, higher gain antennas are affected most.
Most satellite users have CP antennas and find that they perform much
better with a fiberglass crossboom than with a metal crossboom. I can
vouch from personal experience that a metal mast does distort the pattern
enough to make a significant difference in the performance of such an
antenna. For the typical FMer's short antenna of 5 to 8 elements, the
main lobe is large enough that pattern distortions go unnoticed by most
operators.

> Suppose I have a NON-conducting mast. Now I need to get the cable away

> the boom/parallel to the elements? How many dB of difference will this
> make?

Yes, even the coax makes a noticable difference. Routing it out the back
and letting it hang down in a loop to the mast gives a cleaner pattern
than dressing it neatly down the boom and down the mast. Any unintended
metal in the plane of a yagi's elements makes a difference. The degree
of difference depends on the gain of the antenna. It's of no practical
consequence in a low gain yagi, but in a DXer's beam, or a satellite
enthusaist's beam, or a moonbounceer's array, it can make the difference
between success and failure. In one particular antenna I was using for
satellite, a pair of stacked Cushcraft 32-19 long boomers, it made a 3 db
difference in boresight gain.

> In every issue of Popular Communications, there is an ad for a super
> long play recorder from AMC Sales Inc. It uses a "modified" Panasonic
> Slimline cassette recorder to stretch a one hour tape into six hours.

My comment: WHY bother to butcher a cassette recorder? Their audio is bad enough at normal speed and would be awful at 1.875 / 6 inches per second.

My solution: I use a VHS VCR on the six-hour speed (with "two-hour" tape).
You can get eight hour recording time with T-160 tape.
With VHS HI-FI, you get REAL high-fidelity performance, in stereo, and LONG recording time. Name-brand "two-hour" VHS cassettes cost about $3.
I record a four-hour radio program every week in VHS HIFI. When I will be away more than one week, I buy an eight-hour tape to record two weeks' worth of four-hour programs.

Just a suggestion from someone who hasn't found any other way to get long-duration high-quality audio records.

Bob Carpenter, W3OTC (yes I'm back on the list)

A little more information would be welcome. What is the construction
design of the antenna? I'm not familiar with that model. Is it a
trap dipole, or a vertical, or what?

> I find that I cannot get the antenna to run full power
> (100 watts). I get real bad RF bite after about 60 watts

> ground. The ground does help, but only so much. The
> SWR I can get to match 1:1 or very close to that. I have
> even tried making an RF choke with the coax.

Well RF on the rig sounds like the antenna has no counterpoise. The
1:1 SWR is puzzling. Is this with a tuner, and if so, what kind?
What's the SWR look like on the antenna side of the tuner? Does
adding a few feet of coax between the SWR bridge and the antenna
change the SWR reading? The shutdowns you are experiencing sound
like they are caused by RF getting back into the power supply
regulator. The other more normal type of shutdown, high SWR,
wouldn't "blink" the radio. The fact that an RF choke didn't help
may indicate that the RF is getting in the rig from a path other
than the coax. How far is the rig from the antenna? How far is
the antenna from power wiring?

> My dad has run this antenna with his TS-530S (tube finals)
> and had no problems. He even got some DX with it. I
> have had only one contact on 40m with it and they were

>headphones during takeoff. Presumably they don't want you rocking
>to the rhythm, or listening to a qso, when they're giving crash
>instructions.

I just got back from a trip to Atlanta and had no trouble carrying an FT-470 and a Walkman in my briefcase as well as two AC adapters, a SONY ICF-7600D and a Bearcat BC-100XL in my carry-on suitcase (Yes, I know I had more electronics on me than the aircraft!) I do question the listening. Unless the law has changed recently, it is still illegal to turn on a radio in the aircraft either receiving or transmitting. This dates back to the 1950's. I wish I could because the Bearcat has aircraft reception. I usually use it in the terminal to listen to ATIS before boarding. I like to know which runway we are going to use and what the cloud ceiling is.

Source record: 293605

I've lost the e-mail address for the op from ZM2K, so I'll have to post this request.

I'll be operating at N4WW in the CQWW SSB, and I'm glad to hear that you guys will be back, hopefully as a multi-multi. I'm most concerned about working you on 75 (though I hate to admit it, but I missed ZL on 40 last year as well). What frequencies can you operate on phone on 75 down there? Can you work up in the US phone band, or do you normally work split?

Thanks,

Ron

=========
SpaceNews
=========

MONDAY SEPTEMBER 16, 1991

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* MIR NEWS *
============
The still manned space station MIR passes during the night hours, but
gradually the passes shift to the evening hours thus enabling us to pick
up some radio traffic.

On 28 or 29 August 1991 with the engines of Progress-M9, the orbit of MIR was
adjusted, so Keplerian data older than 29 Aug. cannot be used any longer.
On 4 September 1991 a Moscow TV programm relayed an interview with the crew
by Pyotr Orlov.

Some facts from a reliable source in Moscow:

Until the establishment of a new government for the renewed Union (so after
the Session of the People's Deputies and the new Supreme Soviet) all new
bugeting decisions are forbidden.

The organizations thus far heading Soviet spaceflight will continue their
work. The State Commission for Manned spaceflight did not undergo any changes
and so the Chairman Col.Gen. Ivanov, V.L., Chief Spaceflight Units, and the
members General Kryzhko, Gen. Shatalov, Gen. Kurinnyy and the civilians
Semyonov and Sergeyev are still in command. Due to budgetcuts the 2 EVA-s for
this month have been put back or cancelled, so instead of 8 EVA-s, this crew
will stick to the 6 already executed EVA-s. So, there will be no replacement
of Kristall's solar batteries to Kvant-1, possibly indicating future
changes of Kristall's re-dockin to the axial port and Buran-2 operations.
Operations based on international agreements go on, so the preparations for
the tenth expedition and the guest flight of an Austrian and a Kazakh continue.

* SATELLITE OF THE WEEK *
==========
The "Satellite Of The Week" feature is in response to numerous requests
for amateur satellite transponder passband and beacon frequency information.
All active amateur satellites will be covered in upcoming weeks.

Name : FUJI-OSCAR-20, NASA Catalog Number: 20480, Launched on 07-Feb-90
Orbit : Low-altitude, elliptical, non-sun-synchronous

FUJI-OSCAR-20 is a packet-radio store and forward communications satellite
that also contains a Mode J analog (JA) transponder. It was designed to
replace FO-12, which failed after several years of operation due to a
poor power budget.

Mode JA Inverting Linear Transponder:

Uplink Passband: 145.900 MHz to 146.000 MHz (LSB, CW, 100 watts EIRP)
Downlink Passband: 435.800 MHz to 435.900 MHz (USB, CW, 2 watts PEP)

Mode JD Digital Transponder:

Uplink Frequencies: #1 145.850 MHz
#2 145.870 MHz Connect address is:
Manchester #3 145.890 MHz 8J1JBS
Encoded FM #4 145.910 MHz

Downlink Frequency: 435.910 MHz (BPSK AX.25, 1 watt)

CW Beacon: 435.795 MHz (20 WPM, 60 mW)

Unlike the other packet-radio satellites currently in operation, FO-20
does not require specialized groundstation computer software for BBS
access. Both uplink and downlink packets are sent as plain-ASCII text
or binary data in the case of binary telemetry transmissions. The same
modem hardware used for PACSAT, WEBERSAT and LUSAT can be used for FO-20.

Once connected to the satellite (c 8J1JBS), the BBS responds with:

FO-20/JAS1b Mailbox ver. 2.00
commands [B/F/H/M/R/U/W]
Use H command for Help
JAS>

The spacecraft also transmits BEACON frames containing telemetry or short
text messages, such as:

8J1JBS>BEACON <UI C>:
JAS1b M0 91/08/17 20:04:00
Mailbox is at your service from 91/08/01 05:25:00
The JD Transmitter is available in all orbits
during JD mode.

8J1JBS>BEACON <UI C>:
JAS1b RA 91/08/18 20:18:58
454 484 680 689 854 839 849 834 001 726
615 000 434 486 505 477 494 512 652 000

676 758 653 676 999 643 874 278 208 000
010 111 011 000 111 100 001 111 111 000

These FO-20 packet frames were copied last month at KD2BD during BPSK
modem development and testing.

* TNX FOR RPTS! *

SB DX @ ALLBBS $KT7H256
RTTY DX Notes 1of3 9/13/91
RTTY DX Notes for week ending 13th September 1991
BID: KT7H256
Part 1 of 3.

To open, let me say that no amateur 'owns' any part of the bands. We
use the bands, or part thereof, by gentlemen's agreement between the
various modes. But again there have been arguments as to who should
be where. It seems that the main protagonists are the packet
operators, followed by CW. So lets try to bring some sanity to the
situation. One of my overseas reporters has suggested the following,
with which I agree in principle. This is for the 14 MHz band, but
other bands may be considered along the same lines.

Packet 14090 to 14110 KHz, RTTY 14070 to 14090 KHz, AMTOR 14050 to
14070 KHz, CW 14000 to 14050 KHz. With the decreased use of CW and
the increased use of the other modes it seems fair to all. Now don't
cry out or abuse me, but write to your local/national magazine, or
your local national radio society and really find out what the
consensus of opinion is. Don't be a dog in the manger. try to find
out what the majority of people really want for the betterment of us
all.

Our thanks this week go to CE3GDN, DJ3IW and the DB0SPC Cluster,
I5FLN, IK5AAX, K4FJ, K0AB, LZ2BE, OD5NG, SP4KM, SP4TKK, TG9VT, VK2EG,
WB2CJL and Pete. Thank you all for your great help with the notes.

SB DX @ ALLBBS $KT7H258
RTTY DX Notes 3of3 9/13/91
RTTY DX Notes for week ending 13th September 1991
BID: KT7H258
Part 3 of 3.

QSL Information.

XY0RR cards go to Romeo Stepanenko, Box 812, Sofia 1000 Bulgaria.

HL9HH says to QSL via UB5QDF.

KG6DX is Joe Chalmers, 93 Gardinia Ave, Latte Heights, Guam 96913.

ST0DX says to QSL via WA2NNA.

TA7E is at Box 76, Trabzon, 61000 Turkey.

CO2JJ says to QSL to Box 1, Habana, Cuba.

Cards for KC6DX go via JA2NVY.

4K2OIL will QSL via UA9MA, Box 431, Omsk 644099 USSR.

Notes of Interest.

Albania (ZA) should start to appear around September 15 with some trainees, and later around the 23rd they will be looking for some DX.

3B8CF/3B7 Jackie says that he will be there for about another three weeks, so keep it cool chaps.

YA0RR cards are starting to appear. Dima says that he is busy with the posting.

W6/G0AZT and AA5AU will sign V2 from September 28 to 30 in the RTTY contest. Then they will go to VP2M from September 30 to October 7. QSL W6/G0AZT cards to Box 5194, Richmond, CA 94805 USA, and AA5AU to his callbook address.

San Felix (CE0X/XQ0X) is expected to start around October 1. The gear has been checked and the operator (John) is fluent with its operation. QSL to CE3ESS. More details later.

And finally, John TG9VT has been cleared, and will not have to undergo surgery. It is believed that if his smile had been any wider he would have tripped over it. Good luck John and Chiqui.

GL DE DX1 (VK2SG)

2733. FT-5200, 465 MHz Rx?

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-14 23:25:13 UTC
From: val@swamps.UUCP
Message-ID: <526@swamps.UUCP>
Source record: 293612

Is there anyone aware of whether the Yeasu FT-5200 is capable of receiving in the 465-470 region? It would be useful to know whether hardware mods are necessary.

The Spec sheet for the FT-5200 shows:

430-450 MHz
140-174 MHz (Rx)
140-150 MHz (Tx)

Additionally, has anyone who has considered the FT-5200 looked at other small-sized dual band mobile radios? I'd appreciate any comments, as I am looking for a smaller sized radio to solve mounting problems in a newer car.

fletcher@lode.uwyo.EDU (Walter Reid Fletcher) writes:

[speaker cable bs deleted]

>I wish this was April 1st.

>I'm not kidding. Some audio salepeople have told me this straight faced.

It's worse than that. About once a year I pick up a copy of "Audio"
magazine just to get a laugh. It's entertaining to see what new
lies the used car-cum-golden ear bunch has come up with. I'll quote
a couple of the better one:

From Tara Labs, advertizing a speaker cable about an inch in diameter
with hermetic seals on each end.

"Lose yourself in the sound of the new Quantum Series audio cables
from Tara Labs, the makers of the famous Space & Time cables. The
power dynamic sound of the Quantum series cables will transform your
audio system. You'll hear a deep base "puch" and a crystalline treble
clarity that's like hearing music for the first time. Our cable
configuration and natural fibers virtally eliminate electrostatic
noise for pristine high frequency detail and ambience.

"And if that's not enough to give you goosebumps, Quantum Series
cables start at a mere $2.95 per foot"

From Monster Cable above a picture of what looks like 1/2" fiber reenforced
garden hose with connectors. The space between the hose and the gold plated
spade lug (Does it ever strike you funny to see 0000 welding cable being
terminated in a #8 spade lug? :-) is sealed with little rubber bellows
like you might find on your rack and pinion box in your car!

"Every once in a while a product comes along that no audiophile can
dispute. The new M series cables go one step further, bringing
you one step closer to reproducing the musical event (not merely
"music" but a "musical event :-) For the serious audiophile
listener who wants to extrapolate (I think they meant "extract")
every last nuance of the musical performance, we've developed NEW
technologies. Incorporated in every M series cable, Multi Twist (TM)
enhances the mechanical integrity of the cable for a more coherent
reproduction of delicate harmonic structure and detail. Our new
Isotec (TM) dampening material isolates individual conductors from
outside vibrations(!!!) which can generate signals that interefere with
the music.

I really cherish these ads not only for the laugh but also to be able to see an embodiment of one of my philosophies of life. That is "People should have to pay for the priviledge of being stupid."

What, no oxygen free copper? Then again if I had a 2 kw audio amp, I
wouldn't want to waste a watt either ;-}.

This a little off the subject, but...

I heard he was taking bets (2:1 odds; you pay him twice the bet if there is an earthquake) that there would be an eathquake (at least 5 on the richter scale) on thursday. Not sure if he's paid off yet. (As far as I know there wasn't an eathquake, btw.)

Now, since he is searching for RF signals (which, btw were also noted by a stanfor univ. project right before the loma prieta quake of '89), I wonder if anyone has thought of generating some false signals around his station. In fact that may be what happened: he did come close to predicting a recent quake off the coast of northern california about a month ago. This 'prediction' was publicized some what after the quake. Then he made this more recent prediction. (Still he could be correct, but off by a few days -we're still waiting and keeping the valuables off high shelves. B^)

From: jess@admiral.uucp
Message-ID: <4HaB91w164w@admiral.uucp>
Source record: 293518

To those who were interested in receiving the notes on how to build a flexible colinear antenna from coax, I am happy to report that Rich, KA1OF, finally found his paperwork and I have about 20 copies of the notes. Each set consists of one page of explanation and four pages of sketches. As such, unfortunately the notes are not appropriate for upload here so I must resort to mail for distribution.

I'm going to mail them tomorrow to the four or five people who requested them. If anyone else is interested I'll be happy to send them upon receipt of an SASE, to the following address:

Jess Girard ND1L
2 River Oaks Road
Westport, CT 06880

The antenna is made of coax (RG-8/U) with a matching section of RG-11/U. It has about 8 db of gain over a dipole. It can (but need not) be put inside plastic pipe or fiberglass tubing to be self-supporting.

Unfortunately, it still *is* a requirement on HF, even for the use of
the more modern modes like AMTOR.

Funny maybe, but you aren't starting a car with this thing, and the time periods for huge currents flow in the cable are microscopically short, so there is no danger of the tiny spade lug being destroyed by the load. And the resistance losses in the 1/4" or so of spade lug are insignificant to begin with, whereas those that can be saved by using welding cable as opposed to common lamp cord are considerable. The speakers are only 4 ohms, after all.

But technical reasoning aside, it really hurts if as an EE graduate, you accompany a techno-illiterate friend to a high-end stereo store. I did that once and tried to interpose when the salesman very nearly succeeded in selling $800 cables to my friend. I didn't gain favour on either side in the process, though luckily my friend decided to think it over and never did end up buying the things. He already had perfectly adequate large caliber twin lead cable, that contained as much copper as the stuff they were trying to sell him.

Sorry for extending this thread in the wrong newsgroup, I'll shut up now.

AO-16 BBS SHUTS DOWN TEMPORARILY

HR AMSAT NEWS SERVICE BULLETIN 257.01 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 14, 1991
TO ALL RADIO AMATEURS BT

AO-16 BBS "Goes Down" Temporarily During Upload Of New File Server Software

In an attempt to upload a "new-and-improved" version of the File Server
software, known as FTL0, AO-16's on-board computer (OBC) "hiccupped" over
North Africa on 11-Sept-1991 at 20:35 UTC. This immediately sent the AO-16
world-wide Ground Command Team of I2KBD, KB5MU, WD0E, and its Team Leader
WB9ANQ, into action. This latest version of FTL0 had been scheduled to go
into effect early this month and it incorporates many new and excellent fea-
tures which are now available on UO-14's BBS. G0/K8KA and NK6K have corrected
"bugs" and enhanced the efficiency of the BBS operation. The FTL0 uploading
process was begun again on 13-Sept-1991 at 02:50 UTC after NK6K found the
"pesky" parameter which was not set to the "proper" value for AO-16. WD0E
reports that the FTL0 software reload was completed by KB5MU on 14-Sept-91
at 05:00 UTC. All users will be pleased with this new version of the BBS soft-
ware because it now incorporates the "hole-filling" feature. Specifically,
it works like this: If you are "broadcasting" a file from AO-16 and you don't
get it completely downloaded during a pass, you don't have to have the BBS
restart the process again from the beginning of the file on the next pass.
According to WD0E, you simply use the "FILL" function on the newest version
of the PB.EXE program and PB will remember where you were and the broadcast of
the file will start from that point. Also, if you only get "bits-and-pieces"
of a file from AO-16, the "hole-filling" feature will only download what you
need to complete the file. WD0E points that this is much more efficient way
to move files from the PACSATs and encourages users to use this feature for
now on.

The Command Team regrets to inform all users that the files which were stored
aboard AO-16 before the OBC crash are lost. However, the good news is that
the new FTL0 software will allow the number of files to be stored on AO-16's
BBS to be increase from 700 to 800 files! If users wish to utilize the many
new features of this updated FTL0, they need to download from UO-14, or from
COMPUSERVE or from the AMSAT/DRIG land-line BBS the latest version of the
PB.EXE (PACSAT BROADCAST) program. PB.EXE and the associated documentation
can also be found on COMPUSERVE's HAMNET Forum under the file name PB0509.ZIP.
```

Likewise, it can be downloaded from the AMSAT/DRIG land-line BBS, (214) 394-7438, from the "files" menu. This newest version of PB.EXE will have a version number of [910509m] located in its "options-bar." But NK6K would like to point out that older versions of the PB.EXE program will continue to work but obviously you will not be able to use the "hole-filling" features.

Please stay tuned to the AMSAT News Service (ANS) bulletins for further updates on the status of AO-16.

SB ALL @ AMSAT $ANS-257.02
NEW AO-16 BBS FEATURES: PART I

HR AMSAT NEWS SERVICE BULLETIN 257.02 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 14, 1991
TO ALL RADIO AMATEURS BT

NK6K Explains The New File Server S/W Features For AO-16's BBS, Part I

We have incorporated the latest changes from G0/K8KA into the AO-16 version of FTL0 and MFILE. These changes will be in effect when the BBS comes back up in the next day or two.

Here are the visible and not so visible changes in the new upload.

File Broadcast

The broadcast facility should now be far more useful. The following changes have been made:

1) Only one file per user is allowed in the broadcast queue. If you request a second file while you have another file in the queue, the first file is replaced by the second.

2) A file is removed from the broadcast queue after 10 minutes, even if it has not been completely sent. This will avoid having large files still on the queue after the originator has passed out of range.

3) A queue status message will be sent each 10 seconds. This will let you know if your file is still on the queue, and when you might expect to see your frames. This status message is sent to PBLIST, the format is

PB: call call call

where call is the callsign of the station which requested a file. If a command station has marked a file for permanent broadcast, the file number followed by "L" is displayed. For example,

PB: nk6k g0k8ka 1904L

The left-most call has broadcast frames sending, the next call will be next. Each call gets 10 seconds. This parameter is variable, and may be changed. If there are four users logged in and downloading files, there may only be one or two broadcast frames sent in any one slot.

4) The hole fill command is now implemented. If PB shows that some frames are missing, use the Fill command to get them. Do not use the Begin command a second time.

5) If you request a file that does not exist, you will see a frame sent to your call containing "NO -2".

6) If you request a file when the BBS is shut, or if the broadcast queue is full, you will see a frame sent to your call containing "NO -1". Ten files can be on the queue at one time.

We suggest that you use PG to get a file directory, then use PB to broadcast files and fill holes. Use the PB Grab command to capture files started by other users. You may use the Fill command for files you started as well as for files started by others.

[The AMSAT News Service would like to thank NK6K for the information which went into this bulletin.]

NEW AO-16 BBS FEATURES: PART II

HR AMSAT NEWS SERVICE BULLETIN 257.03 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 14, 1991
TO ALL RADIO AMATEURS BT

NK6K Explains The New File Server S/W Features For AO-16's BBS, Part II

File Wash

The file system wash has changed. Previously, only the in-use file blocks got washed. Now, all file blocks will be washed. This has several side effects.

1) The in-use file clusters will now get washed less often. AO-16 only has about 3MB of file space in use at any one time. It is not the same 3MB though, as files are written and deleted, free space creeps around.

We'll now be washing more than twice that, so the revisit rate will be slower than it was. To make up for that, we'll wash a cluster every two seconds rather than every 4 seconds. A cluster is 1024 bytes. We need to watch to see if this has an visible impact on BBS through-put and power utilization.

2) We shouldn't see the bogus uncorrectable errors that show up because sectors in an free cluster that is appended to a growing file haven't been washed, and can have old errors which have become double bit errors over time. Any double bit error now will be because we aren't washing fast enough, or because a Single Event Upset (SEU) flipped more than one bit in the sector.

3) The amount of memory that gets washed will now be a fixed size, so we can make valid statements about the number of "errors-per-bit-per-fortnight."

4) After this warm start, there will be a large number of single and double bit errors as memory which was never washed gets washed for the first time. It will take 4 or 5 hours to wash all the way through once, these errors should be discarded from the status pool.

5) It will not (and has not) been valid to plot SEUs vs sub-satellite point. Since it can take up to 4 hours to get to a particular block, the correction time can be up to 4 hours away from where the error occurred. We would tend to see errors anywhere on the orbit track within 4 hours of the South Atlantic Anomaly (SAA), and in fact the "showlog" program shows this on the UO-14 data. UO-14 washes faster (once a second because their CPU clock is 8 MHz vs the AO-16 4 MHz clock), and has half the memory, so the revisit rate is less than an orbit. SHOWLOG shows two clusters of errors, one over the SAA, and one opposite on the back side. Even though the usage is highest over Europe and the US, where additional errors caused by reading files would be occur, the error rate displayed by showlog is not very high over Europe because the geometry is such that Europe is not seen within a wash time of the SAA.

6) The name of the error log is now ELTLOG instead of ELTLOGXX.

7) If the error record's function type is 2 (read), the file number is not valid. If the function is 1 (wash), the file number has the following meaning:

-2 Free cluster

-1 FAT cluster

0 Directory cluster

other File Number

Bug Fixes
---

1) The correct SSID will now be sent in the broadcast request "ok" messages.

2) Broadcast requests are now added at the end of the current queue rather than a random location.

3) The problem with broadcasting partial files is fixed.

[The AMSAT News Service would like to thank NK6K for the information which went into this bulletin.]

PACSAT NEWS

HR AMSAT NEWS SERVICE BULLETIN 257.06 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 14, 1991
TO ALL RADIO AMATEURS BT

AO-16 Experimenter's Day Schedule Announced

AO-16 Command Station Bruce Rahn, WB9ANQ, has announced the following PACSAT
Experimenter's Day schedule for the remainder of September and first week of
October:

DATE START TIME END TIME MODE

18 Sep 0530 UTC - 18 Sep 0640 UTC - 19 Sep RCO
25 Sep 0530 UTC - 25 Sep 0500 UTC - 26 Sep RCO

02 Oct 2110 UTC - 01 Oct 2040 UTC - 02 Oct RCO

NOTE: This schedule will be in effect only when AO-16 returns to service (see other ANS Bulleting about the AO-16 crash)

RCO: Raised Cosine Only

Operation of the S-Band transmitter with the raised cosine transmitter will resume in the fall.

While Experimenter's Day operations are scheduled to be conducted weekly, users are reminded that these operations may be shortened or canceled to allow uploading of improved spacecraft software. Watch for bulletins in the BBS and the telemetry text frame of AO-16 for changes to the schedule.

Users are requested to send reception reports and comments to WB9ANQ: @AO-16, @LO-19, @UO-14, or via COMPUSERVE to 74017,2454.

/EX

2744. Simplex Auto patch info needed

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-15 20:05:39 UTC
From: neilr@tekgen.BV.TEK.COM
Message-ID: <8353@tekgen.BV.TEK.COM>
Source record: 293615

Do you have experience with a Simplex Autopatch?

I'm thinking about designing and building a simplex autopatch. My questions have to do sensing the incoming carrier in the receiver. I would assume that normal radios produced for amateur service have long time constants in the squelch circuit. That makes them impractical to use `as is'. The controller must sample the receiver for an incoming signal quickly and frequently so as not to break up the telephone audio.

I'm looking for more information on this subject. I would like to enter in a discussion with someone or if you know of further published data I would appreciate it. The tranceiver that I plan on using is the Kenwood TR 7730. Does anyone know if Kenwood has any flyers on mods for it's tranceivers for this type service?

Thanks,

Neil Robin, WA7NBF
(503) 629-1516 or neilr@tekgen.bv.TEK.COM...

I have enjoyed the thread on 390 etc receivers. If you are interested in the 391 I can add a little further info since I have one on the table beside me. There are not very many of these around I suspect since the one I have is serial no. 4 R-391/URR made by Collins. It was made for Signal Corp. US Army, and is nearly identical to the 390 but has an 8 channel selector for remote tuning. I have never touched a 390 ro 390A but read the spec sheets and have the manuals including the "HOW to destroy if captured". I sure hope that the instructions were never followed as I think these are great receivers. I also have a 392 which is really a little brother with not nearly so many knobs or filter positions. Hats off to the Collins group for putting together such a beautiful piece of equipment. It operates better now than any other receiver I've tried (a limited number in nearly 40 years of hamming{)

2746. Receiver wanted

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-16 01:24:48 UTC
From: dkf8117@tamsun.TAMU.EDU
Message-ID: <3497@tamsun.TAMU.EDU>
Source record: 293620

I have been looking for a receiver/scanner. I have a PRO-34 scanner now,
and enjoy it very much. I am looking in the future for a receiver with
the following capabilities:
FULL coverage from around .1 MHZ to 2 Ghz (around that) just wide band
200 or so channels
Ability to receive/translate RTTY, CM, FAX, etc (built-in or with xtra equip)
Spectrum scope or ability to hook into an external one
scan and store

money IS an object, so if corners can be cut for substantial savings, let me
know. I have seen the Icom R-9000, the "ultimate rcvr" but its price tag
is too high. I would like to get in as cheap as possible with the receiver
and then buy the spectrum analyzer, RTTY xlator etc. later.

Recommendations wanted! Thanks!

Duane

2747. was it an R390? the ham club at college had many moons ago?

All these postings about the R390 reminds me of a radio we had at the ham club (w2bsc?) at Steven's Tech in Hoboken, NJ. It was a big monster, did tuning via moving slugs, and vacuum tubes. It had one odd looking tube, which was just a long filiment wound on mica supports. It burned out, and someone ended up faking it's function with resistors. I didn't myself find out what this function was, and why the manufacturer chose to use this tube for this function. This was back in 1974, so my memory is very fuzzy. But seem to remember someone saying that this tube was near the radio's front end.

I remember seeing the manual briefly, and the heading on how to destroy the radio if you anticipate capture by the commies. Think it was Section 86. Maybe that's where the expression "Go 86 it!" comes from.

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

And someone else noted:

> I heard that Alinco fixed the LCD burned-out problem with the newer model
>DJ-112.

I think it's important to clarify this. The DR-110 uses plain old LED digit displays, not LCD. My understanding is that these do go out a lot. Alinco fixed this by placing a backlit LCD into the DR-112. I have a DR-112, and would recommend spending the extra few bucks for the newer model. The LCD would be far superior to the individual LED digits, IMHO.

I use mine on voice and packet. Supposedly, it uses "True FM" and hence is ideal for packet. Don't ask me what that means or why it would matter. :^) All I can say is I got mine at a 'fest for $240, and it's been great. No problems whatsoever, high power output in a small package, and great on packet. Only shortcoming is perhaps a shortage of memories for frequency selections. It has 15, and I'd prefer 20-40.

>* MIR NEWS *
>============
>The still manned space station MIR passes during the night hours, but
>gradually the passes shift to the evening hours thus enabling us to pick
>up some radio traffic.

Now is *the* time to observe manned S/C over your heads! For Europe, at least, the conditions were perfect this weekend: each night, at least two passes of DISCOVERY and one of MIR were most easily visible to the naked eye (both approached or exceeded the brightest stars). Attention: in several German news media there were times of transit for DISCOVERY published that are *off*by*one*hour*! I've traced back the source, Agence France Presse, and they blame NASA for not providing the time zone, just figures. So here it goes: DISCOVERY crosses Germany each day around 20:27 and 22:08 hours Central European Daylightsaving Time (MESZ) = 18:27 and 20:08 UTC. It's coming from the southwest resp. northwest, crosses through the summer triangle resp. Bootes and Ursa Minor and vanishes in the East. At the second transit you can see it vanish abruptly in the earth's shadow!

Here's a question for orbital mechanists: why do we see space shuttles so rarely here in Germany, despite there being quite a number of high inclination missions? This time, the launch took place near midnight Euro-time, and that made it. Why does NASA usually launch in early morning (being afternoon here - no night passes)? Does this just coincide best with the working times of KSC's employees, is it essential for having the emergency runways in good light - or is there a much deeper meaning? When will we have the next mission like the one right now?

Just for reference, here is the pertinent portion of the Federal Aviation
Regulations (FARs, Chapter 14 of the Code of Federal Regulations):

Part 91 Flight Rules/General

91.21 Portable electronic devices.
(a) Except as provided in paragraph (b) of this section, no person may
operate, nor may any operator or pilot in command of an aircraft allow the
operation of, any portable electronic device on any of the following
U.S.-registered civil aircraft:
(1) Aircraft operated by a holder of an air carrier operating certificate
or an operating certificate; or [i.e. airlines]
(2) Any other aircraft while it is operated under IFR [Instrument Flight
Regulations].
(b) Paragraph (a) of this section does not apply to
(1) Portable voice recorders;
(2) Hearing aids;
(3) Heart pacemakers;
(4) Electric shavers;
(5) Any other portable electronic device that the operator of the
aircraft has determined will not cause interference with the navigation or
communication system of the aircraft on which it is to be used.
(c) In the case of an aircraft operated by a holder of an air carrier
operating certificate or an operating certificate, the determination required
by paragraph (b)(5) of this section shall be made by that operator of the
aircraft on which the particular device is to be used. In the case of other
aircraft, the determination may be made by the pilot in command or other
operator of the aircraft. [i.e. when you fly with an airline, it is not
sufficient (or even required) to obtain permission from the captain to
operate (receive *or* transmit) an ht, you must receive permission from
the airline]

The city of Houston (which, BTW, has no zoning - for now) has passed an ordinance basically stating that it is illegal to violate deed restrictions. In particular, a building permit will not be issued for those things that require one if the proposed construction would violate deed restrictions.

To add to John Moore's comment: there are NO subdivisions currently being built in the greater Houston area that allows antennas above the roofline, and damned few that allow any at all. Choice? What choice?

2760. Audio and Albania

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-16 14:29:09 UTC
From: taormina@asl.SINet.SLB.COM
Message-ID: <9109161429.AA22486@sjosu1.sinet.slb.com>
Source record: 293483

It is true that large-gauge stranded copper wire is the most cost effective means to propagate audio from the amp to the speakers. As the audio frequency approaches zero hertz, the impedance approaches zero ohms, requiring a great deal of current to drive the piston of the bass speaker. Also, "skin effect" is a basic factor in all AC signal transmission and is why we use large element conductors in antenna design. These two truisms are why "zip cord" is a poor choice for speaker cables in a "performance" audio system. Beyond that, the manufacturers' claims about all aspects of audio are, at best, subjective and, at worst, deceptive and fraudulent.
There is an incredible disease propagating through the retail sales industry. It consists of 50% ineptitude and 50% insensitivity. Sales people are poorly trained in their products and services and not trained at all in people skills. In the consumer electronics business, there is no consideration given to training sales people in basic electronics theory nor in the function of their products. There is even less training in effective communication with the customer. I find it mind boggling to go into a computer store, audio store and, especially into a Radio Shack and find totally incompetent sales people. They either ignore you, hound you or argue with you. The information they give you is either uninformed, incomplete, incorrect or an outright lie. If a Radio Shack sales person asks to help me, I tell them that I'm making it up as I go along and they, generally, go away.
There is an easy solution. Treat others as you would have them treat you and don't lie. Successful business are finding that out, very slowly. Customer satisfaction and repeat business depends on those two simple principles.

Today is supposed to be the beginning of Ham Radio operation from Albania. The international group will be demonstrating our hobby to the Government officials. Will we treat others as we wish to be treated?

2764. K1EA's CT contest software for non W/VE users

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-16 15:03:02 UTC
From: WKOEHLER@ESOC.BITNET
Message-ID: <91259.162313WKOEHLER@ESOC.BITNET>
Source record: 293485

Last week I got my copy of the CT software. It's version 7.01, the one which uses only two country files: ARRL.CTY and CQWW.CTY. Apart from the fact that both files were not quite up to date and contained duplicate entries I was extremely pleased when I first checked it.

Only during the weekend, when I tried to use it in the WAE contest as an European user operating from DL land, I realized that it does not work for me as far as the multiplier checking and the scoring is concerned. It was designed for usage by W/VE station.

So I had to select CQWW to get an idea how many countries I had worked and on which bands.

Any ideas or solutions on how to solve this problem and make the program more suitable for European users? Any other suggestions on improvement and/or modifications are highly appreciated.

Source record: 293489

Marc Wiz asked if anyone remembers the Hammarlund SP-200 Super Pro. Yes, I remember it very well. In fact, I have one which is a pre-war model which has a frequency coverage between 540khz to 31mhz. It was a fine receiver in its day. By today's standards, it is big, bulky and designed for AM only. The separate power supply is something to behold! Mine is in factory stock condition and was still operating the last time I applied power.

It is interesting to note that I haven't seen another like it in many years. I presume that most have been torn up or scrapped as boat anchors. What a shame because Hammarlund made some fine receivers in support of ham radio's development.

In addition to the SP-200, I also have an HQ-140 operating in stock condition.

Bob, if your mailer does not understand or cannot route using the domain address, you can use an explicit uucp path. Try:

...!uunet!dptspd!callbook

replacing "..." with whatever path you need to get to uunet.

I will shortly be creating a mailing list for people who want to discuss the issues of using amateur radios (especially walkies) on aircraft, the rules involved, the dangers, conveniences, and costs.

As there is nothing new to be presented on these issues that has not already been discussed to death in the various ham radio newsgroups and mailing lists, this will be a write-only mailing list; no need to subscribe.

Complete copies of applicable FAA and FCC regulations have already been posted, so you need not resubmit them. Other submissions may be sent to flappy-talkie@boring.ucsd.edu for rejection.

...

>Is ALINCO any good? Anyone have one? Anyone have trouble with
>servicing the units? Why are they so cheap compared to the rest
>of the market? How do they perform on packet?

Yes, I have an ALINCO DR590 in my car and find it works as advertised.
Biggest problem WAS the user manual, it was disorganized and a mass of
"Jinglish". I have since obtained an updated manual (through the net),
and a service manual via HRO - both are as good as anyone's.

As far as I know service for ALINCO is similar to everyone else - ship
it back to the factory. The "big guys" have several repair depots, but
essentially a major problem will have you QRT for a few weeks no matter
WHO made the rig.

Basically I think it is because they are trying to get established.

Haven't used my DR590 on packet, I use an old Tempo VHF-1 plus for that.
Based on that (vast?) experience I would say that your biggest problem
will likely be wiring the connectors. The TNCs are veryt tolerant of
trabceiver foibles.

> In every issue of Popular Communications, there is an ad for a super
> long play recorder from AMC Sales Inc. It uses a "modified" Panasonic
> Slimline cassette recorder to stretch a one hour tape into six hours.

My comment: WHY bother to butcher a cassette recorder? Their audio is bad enough at normal speed and would be awful at 1.875 / 6 inches per second.

My solution: I use a VHS VCR on the six-hour speed (with "two-hour" tape).
You can get eight hour recording time with T-160 tape.
With VHS HI-FI, you get REAL high-fidelity performance, in stereo, and LONG recording time. Name-brand "two-hour" VHS cassettes cost about $3.
I record a four-hour radio program every week in VHS HIFI. When I will be away more than one week, I buy an eight-hour tape to record two weeks' worth of four-hour programs.

Some decks require that you get a video signal to properly sync the tape. Other than that it is a great way to go. You can even set the timer for particular times to record. The camera remote can turn the record on and off by signal control, depending on the reciever (I am thinking of the R7000).

When I was playing with WEFAX I used my VCR to record the passes. I could set the time for each pass. The big reason for the VCR was the high stability of the recording in terms of "wow" compared to my little sony tpare recorder.

Another hint: if you use cable tv as a video source then you can tune the "directory" channel and use it to time stamp your recordings.

Has anybody out there in netland had experience with Bilal ISOTRON antennas?
I am considering getting one for HF. There are very compact and look ideal
for a rather space limited installation. How well do they receive / transmit?
How well to they hold up to the elements: wind, rain, snow and ice? If you
have had any experiece with these antennas please send me E-mail. I will
summarize and post if I receive enough replies.

In fact, you could record the entire 2 meter band (or 6Mhz of any band) at
one time using a modified VCR. You need to modify the front end or
tap into the IF stages. This gives you a recorder similar to the phone
PBX recorders which record all phone lines using a VCR tape.

2778. Mobile Installation of PRO2006 Scanner

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-16 17:24:12 UTC
From: sdkuo@argo.acs.oakland.edu
Message-ID: <9865@vela.acs.oakland.edu>
Source record: 293496

I'm thinking about purchasing a RadioShack PRO2006 scanner and mounting
in my car. I have two questions:
1) Does anyone have/used/seen the mobile mounting bracket that can be
special ordered for $25 (made for the PRO2006)?
2) Does mobile installation of electronic equipment shorten its life?
That is, since mobile installation is subject to more extreme
temperatures and changes. Also, the PRO2006 doesn't seem to be
designed for mobile use, it's a base unit.

thanks,

Steve Kuo, N8OPH, sdkuo@oakland.edu, sdkuo@argo.acs.oakland.edu

If you are interested in a slight amount "homebrewing", I'm working
on getting the most recent version of "cw" from a friend of mine
and sending it to someone here on the net who has promised to
make it "ftp-able". I also plan to send it to comp.binaries.ibm.pc
as soon as I convert it to zoo (after I get it, of course!).

It uses the PC (sorry, non-pc folks!) to send and receive morse code.
You need some kind of interface to the pc - I've designed one that
should work better than a simple 741 wired as a comparator... Basically
an active filter followed by a comparator, followed by a 555 set up
as a pulse extender (you need a high during the entire time of the
tone). Anyway, it will cost about $10 for parts, plus $10 for misc
stuff that always comes up :-) Plus the computer :-)

Seems to work relatively well.

Hey, I know how to get rid of TPI (telephone inteference).

Just use an old fashioned non-electronic rotary dial phone instead
of a pushbutton model from the local drug store.

It worked for me. I dug our old ugly black phone out of
a pile of junk in the garage and installed it beside my
XYL's bed. Now when the phone rings while I am on the air, she
has been trained to answer the correct phone. Besides I like the
way it rings better anyway, sounds like a real telephone.

Source record: 293504

While conversing with a salesman who said that only Monster Cable should be used in my stereo system, I recalled that several labs have tested the stuff and not been able to find any measureable difference between MC and lamp cord. His response was that the differences are not discernable with any "present day (it was in 1989) measuring equipment".

He added that it's not possible to measure such things as:

ambience
presence
provocativeness
magnificence...

and a whole lot of other undefined "quantities".

I then explained that listeners participating in blind A-B tests also could not tell the difference between Monster Cable and lamp cord. His response was that blind A-B tests are worthless because the listeners "don't know what to listen for". (???)

He said that only a very small percentage of listeners had the aural ability to act as a relevant listener in this type of test. I asked him how to find out who these people are. He said they are those who, when being tested, can determine that Monster Cable sounds better.

Then I said that if only a very small fraction of people can tell the difference, why should one buy the stuff.

The salesman then terminated the conversation very abruptly.

I'm still not convinced.

I just spoke with Ken Wolff, K1EA on the phone. He said first of all that he had hoped to get WAE support from the European side in for version 7, but just ran out of time. It is complicated by the fact that European stations receive QTC reports, which CT has no way to handle, thus, he needs a new interface for this. He said that he would work on it this winter, and it should be ready by Version 8, in time for Dayton next year (late April, 1992). He also expressed a desire for a beta tester:

Msg #162 From: K1EA Date: 17-Sep 0054Z Subj: Re: CT for Europe
Somebody has to sit down with his friends and play fake contest for a couple of hours, trying to do everything that might happen...

Any volunteers? Ken will keep me posted on the progress.

""Can anyone give a review of the various software packages
""advertised in QST for YAGI design? There seems to be quite a
""price range.....Is there any public domain SW that
""analyzes YAGIs?

Try to locate another ham who has a P-C and a copy of the
Callbook on CD-ROM. In addition to the callbook, the CD-ROM
has hundreds of ham related public domain software programs, one
of which is called Yagi Optimizer. I believe its filename is
YAGIOPT.ZIP

I've used this program with very good results. It's rather
user-friendly for such a complex program, and will give you a
complete analysis, including patters, of any yagi whose
dimensions you feed in. My only criticism is that the
documentation is a little vague on the exact details of boom
mounting techniques, and the appropriate way to enter this data.
This may have been improved in later editions...I dunno. I've
seen ads in the mags for later versions, but the price tag scared
me off.

>on the second (or higher) floor of a house/apartment?

For RF ground, use a quarter-wavelength radial for each band in use.
You could also tune the ground wire with MFJ's artificial ground (or
build your own with a coil/capacitor), but be aware that this will not
stop the "ground" wire from radiating. You will have to retune for
each band.

Actually, if you have problems with "RF in the shack", the first line
of attack would be to find the real problem and cure it. This might
mean going to a balanced antenna, using a balun, moving the antenna
farther away from nearby conductors, etc.

Forget about trying to get a good ground at VHF harmonic frequencies.
If you have harmonics floating around on the outside of your
transmitter cabinet and/or coax shield then you need either 1) better
shielding or 2) a good low-pass filter.

For a safety gound (60 Hz), just use a three-prong plug and make sure
your (3-wire) electrical outlets are properly installed.

For a lightning ground, bring the coax into the house at ground level.
Install a coaxial lightning arrestor just before the coax enters the
house and ground the lightning arrestor to an 8 foot ground rod using
a short, heavy (#10 would be good) wire. If you can't obtain a lightning
arrestor, just ground the coax shield to the ground rod.

>to use this tube for this function.

This is a ballast tube. It is used to regulate the filament current in the R390A's VFO and BFO tubes. If you replace it with a resistor, these oscillators will drift. This is not a problem when listening to AM, but SSB listening becomes intolerable (at least on my set).

When the ballast tube in my R390A finally dies, I plan to replace it with a full-wave rectifier and DC current regulator (e.g., 3-terminal voltage regulator and load resistor). BTW, this is essentially the same method Sony used to control the speed of the 60 Hz capstan motor in my 20 year old reel-to-reel tape deck.

>>my phones (note: my rig is a 2kw pep rig)

and

>WA6LKI responds:

>Radio SHack has some clamp-on ferrites. Try them right next to the
>phone instrument.

and I add:

Don't waste your money. I tried these Radio Shack "miracles" and they
aren't worth the powder to blow them to HH-land. Instead try a ferrite
rod. Wind 10-20 turns of the phone cable (the one that comes from the wall
jack to the phone), right at the phone end on a 3.5" ferrite rod. If you
transmit when you do the winding you can notice how the interference just
"disappears", the choking action is quite dramatic. You can get ferrite rods
from Amidon Assoc. in CA., or any other supplier that carries ferrite.
I have at least one rod on virtually every RFI susceptible device in my
home. On AC operated devices the power cord is wound on a rod that is placed
right at the entrance to the device. The TV, stereo, TV preamp, etc., also
have the coax wound a rod also.

Don't feel bad. I've been fighting RFI all my (25) ham years and every time I
think I've got it licked, some new "thigga-ma-jig" is brought home that is
RFI prone. Then the de-RFI'ing process starts all over again... Good Luck.

Richard Eckman KD4AUS writes:
> I am in the process of getting an HF station on the air. My shack is
>on the second floor of a house, some distance from any source of good
>earth ground.

As you know, it will be difficult to get a good ground in your shack.
A balanced antenna, and a balun will do a lot to keep RF where is
belongs. Leakage from the transmitter cabinet may also be more of a
problem than for one closer to ground. You may to improve the
shielding and add more filtering on some of the wires.

Look on the bright side. You won't have to spend as much on coax to
the antennnas. :-)

Gary Coffman gary@ke4zv.uucp
writes:
< ... many lines deleted ......>
>In some special cases it is desirable *not* to have an RF ground, but a
>safety ground is always required. In these cases use a choke in the
>safety ground lead or use the inner conductor of a piece of coax with
>the braid connected only at one end. This forms a waveguide beyond
>cutoff filter.

Although I agree with the rest of Gary's advice, the coax does not
have anything to do with waveguides in this application. Connected as
described, you can not launch any sort of waveguide mode inside the
cable. What this is really is a shorted stub. At a frequency where
the coax is 1/4 wavelength long (after taking into account the
velocity factor of the dielectric, typically about 0.7) it will
present a high impedance resonance. When it is 1/2 wavelength long,
there will be a low impedance resonance. The high impedance will also
occur at odd multiples of 1/4 wavelength; and the low impedance will
repeat at even multiples.

I go away for a few months and you are still discussing HTs on aircraft.

After attending a seminar on EMI/EMC, and hearing the story about a plane crash caused (determined by investigating board) that someone listening to a radio Walkman (I don't remember the frequency band), I quit even thinking of listeningto the HT. The problem is the strength of the IF oscillator outputs, some being of a large amplitude swing into the mixer. These do leak from the radio and interfere with aircraft instruments through wiring (or other mechanisms).

So, for my sanity, I disable my radio by removing the battery pack and antenna for the flight, and ask that if you are on my flight, to do the same.

Thanks.

Source record: 293519
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave

Gee, didn't see any postings about this yet - at least what has so far arrived at my site...

Got a letter today in the mail from Grove Enterprises Inc. I'm one of the 150 or so people waiting for a AR1000XC/XLT. I've been waiting about 2 months with the repeated promise [from Grove] that I'd get a AR1000XC at a certain data, and of course, I still don't have one.

Well, the letter says that they are dropping this line of AOR products and cancelling all back orders. It also goes on to say...

"This decision does not come lightly; we will lose approximately $100,000 in orders. But the loss in revenue cannot begin to offset the credibility damage we have suffered trusting the word of our supplier."

The letter goes on to recommend alternatives to the AR1000 (ICOM R7000 and PRO 2006) and offers to pay UPS shipping on any replacement order anywhere in the USA until Oct 15,1991.

Gee, "credibility" and "business". Congrats to Bob Grove for his ordering of priorities.

2796. Update to 'An Open Letter to the ARRL' [H.R. 1674]

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-16 22:44:00 UTC
From: 0003829147@MCIMAIL.COM
Message-ID: <21910916224412.0003829147NA2EM@mcimail.com>
Source record: 293516

I apologize in advance if this post is a bit lengthy, what follows is correspondance between myself and the ARRL over H.R. 1674, part of which affects the manufacture of scanner radios. You might find this quite informative as it posts ARRL's position on the bill and their specific reasons behind it. At the same time, I elaborate on the concerns I still have behind this bill.

All follow-ups, whether by post or by mail, are welcome.

Date: Mon Sep 09, 1991 8:55 am CDT
From: Perry F. Williams / MCI ID: 224-2662

TO: * Sander J. Rabinowitz / MCI ID: 382-9147
Subject: H.R. 1674

Thanks for your MCI message of September 5, 1991 regarding H.R. 1674 and scanners. I haven't located your earlier message, and am uncertain whether someone else here has answered it.

The League has not supported legislative approaches to problems of privacy in communications. In fact, a decade ago we helped achieve an amendment to Section 705 of the Communications Act so that it does not apply to transmissions by an Amateur station. Currently, we're attempting, in Private Radio Docket 91-36, before the Federal Communications Commission, to secure a declaration of Federal preemption of local and state laws restricting scanning receivers which are part of amateur radio equipment.

The language related to scanners in H.R.1674 is specific to the domestic cellular radio service (in the 800-900 MHz band). How would that hurt the Amateur Service? If we opposed the bill in principle, would it appear that Amateurs encouraged other folks to listen in on private conversations?

On the other hand, other parts of H.R.1674 as it has emerged are beneficial to the Amateur Service. Wouldn't we put the legislation we want at risk by gratuitous opposition to language we don't believe hurts Amateurs?

Sincerely,

Perry Williams, W1UED
Washington Area Coordinator, ARRL

Date: Mon Sep 09, 1991 7:03 pm CDT

Subject: RE: H.R. 1674

Handling: Receipt
Message-Id: 41910910000314/0003829147NA1EM

Dear Mr. Williams,

Thank you for taking the time to respond to my September 5 letter to the ARRL regarding H.R. 1674. You noted some valid concerns in your reply regarding what ARRL's position should be on the legislation. I therefore would like to clarify my position.

Let me begin with where you wrote:

>The language related to scanners in H.R.1674 is specific to the domestic
>cellular radio service (in the 800-900 MHz band). How would that hurt the
>Amateur Service? If we opposed the bill in principle, would it appear that
>Amateurs encouraged other folks to listen in on private conversations?

I should have stated this in my original post: My concern is not that it affects the cellular band or the transmissions therein. And it has never been my intention to violate the Electronic Communications Privacy Act of 1986 (ECPA '86).

My concern is over the way the legislation is written. It is vague--particularly in section 8b) which deals with the "readily altered equipment" clause. What constitutes "readily altered equipment"? I would submit to you that virtually any scanner, including those which receive only up to 512 MHz, can be converted to receive cellular frequencies through the use of a converter device. *Any scanner* under H.R. 1674--indeed, any VHF/UHF radio receiver could be considered "readily altered equipment". That's my biggest concern.

>The League has not supported legislative approaches to problems of privacy
>in communications.

Then we may be in agreement on the issue of that portion of H.R. 1674. It's unnecessary because in the first place ECPA '86 explicitly prohibits listening to cellular communications, and in the second place because even with the implementation of the proposed legislation it is unrealistic to expect that privacy will be assured.

>Currently, we're attempting, in Private Radio Docket 91-36, before the
>Federal Communications Commission, to secure a declaration of Federal
>preemption of local and state laws restricting scanning receivers which
>are part of amateur radio equipment.

And I sincerely appreciate those efforts. But let me ask you: If the manufacture of scanning receivers winds up be sharply curtailed or prohibited because of 8b) of H.R. 1674, what good will that do? "No, you can't buy a scanner, but if you happen to have one, you can use it in your car."

Repeating your question: > How would that hurt the Amateur Service?

You stated yourself that scanning receivers can be and are a part of amateur radio equipment. Even if the manufacture of scanners is to continue under 8b) of H.R. 1674, there would undoubtedly be costs associated with modifying the radios that would be passed on in the cost of the equipment. This cost would be passed on to the people who buy the equipment, including ham operators. Is that fair?

Second, if we were to make this concession, it implies that even amateur radio operators can't be trusted to even *approach* that portion of the band, let alone listen to it. It seems to me that amateur radio operators are in a high position of trust when it comes to the matter of radio in general--both when it's transmitted, and when it is received. We would expect that ham radio operators would be fully knowledgeable of all the rules and regulations related to radio, including ECPA '86. The proposed legislation undermines this trust, by crippling a tool that amateurs use *unnecessarily*. Again, I ask you: Is this fair? My personal answer is no. It isn't fair.

>On the other hand, other parts of H.R.1674 as it has emerged are
>beneficial to the Amateur Service. Wouldn't we put the legislation we
>want at risk by gratuitous opposition to language we don't believe hurts
>Amateurs?

But I have shown that this legislation can and *will* hurt amateurs. It's costly, vague, unfair, unnecessary, and above all it undermines the trust and respect that amateur operators are entitled to.

I do realize this puts the ARRL in a difficult position, incidentally. You mentioned that if you went against this legislation, you would be seen as "supporting illegal listening practices," while at the same time there are provisions beneficial to amateur radio. I hope you would elaborate on those if you have the opportunity. But I would also hope you would not support or deny a bill based merely on perceptions. The consequences of Section 8 of H.R. 1674 are not miniscule. I do hope you will take it seriously.

Best wishes.

Sincerely,

Sander J. Rabinowitz
1032 Cooks Ct.
Brentwood, Tennessee 37027

Date: Tue Sep 10, 1991 9:57 am CDT
From: Perry F. Williams / MCI ID: 224-2662

TO: * Sander J. Rabinowitz / MCI ID: 382-9147
Subject: H.R.1674, AGAIN

Dear Sander:

You write a good letter -- it's clear you're giving this matter a lot of thought.

My impression of what was meant in Section 8 by "readily altered equipment" is a variation on the "freebander" equipment ploy: "Absolutely do not cut the red wire; it would cause you to listen illegally in the 800-900 MHz cellular telephone range." While a scanning tuner/converter for 800-900 MHz might well be considered to be covered by the phrase, it would seem an improbable stretch to apply it to any receiver designed for other bands.

Nevertheless, there is no reason why you should not let your concerns be known to those who are enacting the legislation. Why don't you convey them to Rep. Jim Cooper of Tennessee's 4th District? He's an active, interested member of the Subcommittee on Telecommunications and Finance, House Committee on Energy and Commerce. The address is: 125 Cannon House Office Building, Washington DC 20515-4204. H.R.1674 has been approved by the Commerce committee, and could come to the floor for vote of the full House at any time, now Congress is back in session. You may want, therefore, also to send a copy to your own Congressman, Bart Gordon, 103 Cannon House Office Building, Washington DC 20515-4206.

What do we like about H.R.1674? It proposes that the Communications Act be amended so that the Amateur community may assist the FCC in the provision of call signs for amateur radio clubs. Secondly, though it sets up a system of user fees, the bill exempts public-safety licensees (police, firefighters and the like), non-profit entities (e.g., college broadcast stations) and amateurs from the fees. [There is room for debate in principle, as to whether amateurs should oppose user fees; however, all proposals for amateur fees so far have been "front-loaded," disproportionately landing on new and upgrading licensees and burdening the 25,000 or so volunteer examiners who would have to collect and be responsible for government funds.] Finally, the House bill does NOT include an amendment to the Communications Act which had been requested by the FCC. [The FCC's proposed amendment does appear in the Senate version of the Authorization Bill, S. 1132. It would delete a requirement in interference cases that changes in the frequencies, hours of operation or power of a station be subject to a hearing. To our mind, the due process rights of individuals could be sacrificed on the altar of administrative convenience, should the Commission get its way on this.]

Thanks for writing.

Sincerely,

Perry Williams, W1UED

Source record: 293517

WaltK@pica.army.mil (Walter Kornienko, GC-HSI) writes that the yagi package residing on aupair.cs.athabascau.ca in /ampr/yagimax.lzh might be corrupted.

I moved this file from aupair to my PC, a rather decrepit 8086, via zmodem and unpacked it using a copy of lha270.exe that I snarfed from oak.oakland.edu.

Lha said the archive was ok, and unpacked it without complaint; when I tried to start it (naturally, I did not read the doc! Doc is for when you're stumped, right :-)? it died with a complaint about `illegal function call in <mumble> at line <mumble>' or somesuch.

So I think the package probably needs configuration, or a command-line arguement, or more memory. But I think the archive file proper is OK. Any other volunteers to check this thing out? Thanks in advance. Sure hate to think it might be corrupted (but at least lha doesn't say so.)

Of course, not to defend these guys, but how many people use
22-gauge aluminum 'speaker wire', 50 feet long per side,
then coil up the remaining 45 feet behind the speakers?
Makes a dandy inductor/dummy load even at audio frequencies.

At $2.95 per foot, I'd measure every inch to my speakers!

]ordering of priorities.

Bob Grove is a good guy. By the way, I called ACE today to check on the AR3000, and they referred me to a review on it by Bob Grove. I asked if I could buy the scanner from Grove, and they said that he was dropping their line because of supply problems. Apparently other dealers are also dropping their line.

Source record: 293379

Well, I tried to mail this to you, but the site insisted that
you were not a printer, so now it will be posted to the world.
Is it that the vax does not handle net replies?

Marv,

I saw your posting on the R-391 after a friend in the Netherlands
brought it to my attention. I've developed a strong interest in
the Collins military receivers. They represent the peak of tube
technology in response to ever more wonderful military requirements.
Now I own an R-389 with the early manual, an R-390, and an R-390A
with copied manuals. Copying destroys the arrangement of the
schematic diagrams, but that's all that's available. I also have
a copy of the Collins development study that describes the design
decisions behind the R-390 and the cost-reduced R-390A. It mentions
the R-391, but gives no details. If you have S/N 4, you probably
have a preproduction model. Where'd you find it? My Dutch friend
says he thinks the Swedes have R-391's, which implies that it went
into production.

I'd like to know a little more about the remote tuning of the R-391,
if you'd answer. The R-390(A) has a 10 turn Kc change knob and 30
click Mc change. The R-389 has a 100 turn Kc change knob and a two
position bandswitch (15-500 and 500-1500 Kc). The Kc change has a
motor drive with a manual up/down panel switch. Does the R-391 have
a motor-driven Kc change? How does it do the Mc change?

You know, you may be the only R-391 owner on the net ...

I'll be out of town from Thursday until next month, so I may not
answer right away.

Yours in awe,

Bill, aka bill@bert.rosemount.com (born 1938)

I have a solid-state version, the ISB-1 produced by Delta Electronics.
Actually, it is a full independent sideband adapter, with selectable upper
and lower sideband outputs on independent audio channels, and a dsb mode
as well. Painted the same shade of gray as the R-390A, it looks awfully
military to me :-) And when I called Delta, they informed me the filters
had cost about $3,000/set. That makes it sounds even MORE military....
It hooks up to the IF output of the 390.

Unfortunate. I ordered my AOR1000XC from ACE Communications on Sept. 9th. I was informed at that time that the unit would not ship until the end of September. On Sept. 14th, I noticed that the unit had been charged to my credit card. I called ACE to inquire about the status of my order (Did it ship yet?!). I was told that they were expecting a shipment of units today and that as soon as they tested a few out of each batch, they would ship. This surprises be, but I'll be skeptical until it shows up on my doorstep!

2807. HR1674 - a possible solution?

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-17 09:13:30 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <17.Sep.91.10
Source record: 293381

A possible way to get round HR1674 and the ECPA legislation is, surely, to describe your scanner not as a scanner, but as a piece of sensitive test-gear which you are using to ensure your ham station is not radiating any harmonics or spurii that may affect other, licensed communications-systems..... :-)

Does ECPA prevent use of spectrum-analysers, Panadaptors etc. that cover the cellular-bands? I suspect not, but surely a spectrum-analyser is a receiver, it just produces a visible rather than audible representation of what is being received.

Note that the above defence has not been tested in a court of law :-)

I'd _sure_ like to see the documentation on this! I regularly read the reports found in Aviation Week and Space Technology concerning aircraft crash investigations and have never seen anything _remotely_ like this. If a Walkman IF does this, think what happens everytime that aircraft goes through active radar! Commercial aircraft manufacturers are _very_ concerned about EMI; the aircraft must fly around and through thunderstorms, etc. where the pulse from lighting is many times stronger than anything you could hope to operate on-board. Pilots I've talked to are primarily concerned about the possiblity of transmitters being received by the aircraft antennas and thus interfering with routine communications. That's why sometimes, where the pilot is given the discretion, you might be allowed to use your H/T after a test transmission. The flight engineer can tell if any interference is present.

I know (not just heard) four pilots who routinely use H/Ts while flying. If it doesn't make them nervous, I'm not going to let it bother me.

BTW, the last time I followed a similar thread in comp.laptops, no hard evidence was presented that any laptop computer had ever interfered with any flight operation. The FAA is one of (if not _the_) biggest CYA organization in the world. And rightfully so! If they had evidence to suggest a direct cause and effect relationship you can be sure that the only way any of the electronic goodies we love would get on-board would be with batteries out, even in checked baggage.

Oh, yes! Despite, you can get a demodulator/audio amp as an option to
almost all spectrum analyzers. And how about a radiocommunications
service monitor? You can get the cheapest brands for a price of not very
much more $$$ than you have to pay for a R9000...

2812. Re: Audio and Albania

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-17 14:34:39 UTC
From: dube@cpdvax.CSc.ti.COM
Message-ID: <199109171434.AA20539@tilde.csc.ti.com>
Source record: 293384

Subject: Audio and Albania

While audio and stereo are sort of out-of-place here, I think there is some value to the Ham in reviewing some of the basic electrical principles involved.

>It is true that large-gauge stranded copper wire is the most cost effec-
>tive mean to propagate audio from the amp to the speakers. As the audio
>frequency approaches zero hertz, the impedance approaches zero ohms,

This is not exactly correct. As the frequencey approaches "zero Hertz" (DC), the impedance approaches the resistive value. The capacitive and inductive reactances are infinitesimally small at the audio frequencies, disappearing completely at DC and leaving the R component of impedance. At low frequencies, the resistances of the load, the connecting cable, and the internal source resistance far outweigh any amounts of inductance or capacitance in the circuit.

One could even offer the idea that, to effect the best power transfer, a 4-ohm speaker requires a 4-ohm driving source and a 4-ohm impedance wire pair to connect them. One could, that is, if the length of the wire pair was a significant fraction of the wavelength involved (which is a little over 900 miles at 20 kHz).

>requiring a great deal of current to drive the piston of the bass speaker.

A 4-ohm voice coil load absorbing 100 watts of power (Egads! In whose living room would this be?) would, by I=sqrt(P/R), require 5 amps of current; hardly enough, in my opinion, to warrant copper pipes or welding cable. Using even #18 AWG, a 10-foot length would have a loop resistance of only 0.12 ohm, and using paralleled zip-cord reduces that by half! With resistance the only significant factor, Ohm's law tells us that our losses enroute to the bass speaker very small indeed. In fact, under these condi-tions, it amounts to only 0.3 volt of the 20 volts appearing across the voice coil. Pay about $1.50 more and you can get two 10-foot long extension cords of #14 AWG and reduce the loop resistance to about 0.025 ohm. (clip the connectors off the ends first). :) Now you've reduced your loss under the same conditions to about 0.1 volt; and you have 99.5 watts of booming bass in your living room from the 100 watts at the amp output 10 feet away. I'm talking *real* cost-effectiveness here! Got long runs to your speakers? Then you ought to use the 70-volt system instead of the low-Z stuff.

>Also, "skin effect" is factor in all AC signal transmission and is why we use
>large element conductors in antenna design. These two truisms are why "zip
>cord" is a poor choice for speaker cables in a "performance" audio system.

Sorry, but I can't agree here either. We're still talking 20kHz here, not mHz; but then I don't exactly know what a "performance" audio system is. Maybe it is one that lets you hear frequencies up to many megahertz; and if so, then I'll back off. Otherwise, I'm convinced that "skin effect" has negligible effect in the audio spectrum.

>Beyond that, the manufacturers' claims about all aspects of audio are, at
>best, subjective and, at worst, deceptive and fraudulent. There is an
>incredible disease propagating through the retail sales industry. It consists
>of 50% ineptitude and 50% insensitivity. Sales people are poorly trained

This I mostly agree with. A few years ago, I was told by one of these snake-oil salesmen that my phono cartridge was inferior to the one he was selling because it didn't have something the company had given a name; a name which described an otherwise standard electrical charactistic of all magnetic cartridges. As I mentioned in another posting, this is born of knowing the terminology without the knowledge of what the terminology describes. The Audio market certainly has no monopoly on this situation. It even exists in the Amateur Radio market.

(Radio Shack bashing deja vu deleted)

>and, at worst, deceptive and fraudulent.

The impedance of a speaker is lowest at, surprise, *resonance*. For most
bass speakers that's around 40-80 Hz in free air. Above or *below* that point
the impedance *rises* sharply. That's why really deep bass is so hard to
make. The impedance of the speaker is so high that little current can be
forced through it. Speaker enclosures are designed to *flatten* the resonance
curve by heavy acoustic *loading* (sound familiar?) in order to extend the bass
response. The typical "high end" audio system supplies an *average* power of
about 10 watts to it's speakers. With 8 ohm speakers that's about 1.12 amps.
On transient peaks the equipment may have to supply up to 200 watts, that's 5
amps. This is well within the capabilities of 16 gauge zip cord. Skin effect
is essentially non-existant at low AC frequencies. At the high end of the audio
range where skin effect begins to be noticable, the drivers are so efficient
that very little power is required to reach ear damaging levels.

Now that Grove has dropped both the AOR AR1000XC and AR3000 scanners and has suggested the new ICOM R-100 and R-1 as replacements, I wonder if there are users who could give comments on how these units operate.

Here are some questions:

1. What are the specs, other that freq. coverage?

2. With the R-1's small size, what is the quality of audio?

3. How well can the display be seen (R-1)?

4. Is the priority channel programmable?

Any info/comments would be appreciated.

NASA wants the short abort runway at the Cape, the Atlantic abort runway
at Rota Spain, and the once around abort runway at Edwards AFB in California
to all be in sunlight at launch time. That means a mid-morning EDT launch.
As NASA's confidence rebuilds, these constraints are gradually being
lifted again. Plus the current launch was to such a high inclination
that the Rota site and the Edwards site would be unreachable if an
abort occured during the ascent or the first orbit.

Paul, I have a FEMA pamphlet here on the protection of radio equipment
in the event of a "national emergency". It states that all cables
should be brought into the screened radio room through a pipe
"grounded at one end". They go on to say "this will form a waveguide
beyond cutoff filter preventing frequencies with wavelengths less
than one tenth the pipe length and more than ten times the pipe diameter
from entering the enclosure via the outside of the cables."

Now they may be wrong, and you are certainly right about quarterwave
stubs, but they call the arrangement a waveguide beyond cutoff filter.

>73 BOB K9CGD

Bob,

Understood. If you are lucky you can find a pre-Hong Kong phone filter from AT&T that was quite effective and was modestly priced. For many, especially neophytes and toaster operators, it was a cleaner and easier solution than fartin' around with ferrite rods or cores.

I had the luxury (my wife convinced me it was a luxury) of building my own home. When I wired the shack I put .01ufd disk caps across hot & neutral lines to gnd in each receptacle. I also tied together with wire & gnded the foil of the insulation in the walls of the shack. What this bought me I don't know, but what the hey. A 8'x5/8" gnd rod is only 4' from the rig. All power strips are (common-mode) bypassed with caps and have MOV's. Virtually all power cords, including linear and rig have either ferrite rods or torroids. All entertainment (dubious description) devices have their pwr cords choked and are fed w/coax. Having gone to coax seemed to solve much of the RF overload problems in the TV. But, with the 204BA pointed right at the TV antenna and running a KW output you learn what 50dB down _really_ means. And you learn not to do that, or you send the family to Disney-World for the duration of CQWW.

With all this, I still can't claim to be totally RFI proofed. With the addition of yet another appliance (386/33 PC) I now see the 3rd harmonic of the computer's 66Mhz oscillator on TV Channel 11. The (new) packet setup gets into the el-cheapo-crapo Hitachi portable TV in the bourdois. So, I find myself always one step behind the manufacturers of these electronic marvels. Next house will be wired with fiber-optic cable or run on infra-red beams or lasers.

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

>

The trick is to balance the voltage as well as the current. I ran a
few experiments, and when the replacement resistor has too large a value,
the oscillators either drift badly or actually *quit* oscillating. I forget
the actual value I used, but I believe it was on the order of 50 ohms.

>When the ballast tube in my R390A finally dies, I plan to replace it
>with a full-wave rectifier and DC current regulator (e.g., 3-terminal

>same method Sony used to control the speed of the 60 Hz capstan motor
>in my 20 year old reel-to-reel tape deck.
>--

I doubt that you would have to go to this extreme. The whole tube
compliment that runs off the ballast only draws 300 mA. Besides, the
balast is nothing more than a hot wire resistor anyhow.

+>
+>After attending a seminar on EMI/EMC, and hearing the story about a plane
+>crash caused (determined by investigating board) that someone listening to a
+>radio Walkman (I don't remember the frequency band), I quit even thinking of
+>listeningto the HT. The problem is the strength of the IF oscillator ......
+>
+I'd _sure_ like to see the documentation on this! ....
+I regularly read the reports found in Aviation Week and Space Technology
+concerning aircraft crash investigations and have never seen anything
remotely like this. If a Walkman IF does this, think what happens everytime
that aircraft goes through active radar! .....

Radar and VOR navigational frequencies are so far removed from each other,
that this argument is not credable.

+Commercial aircraft manufacturers are _very_ concerned about EMI; the
+aircraft must fly around and through thunderstorms, etc. where the pulse from
+lighting is many times stronger than anything you could hope to operate on-
+board. Pilots I've talked to are primarily concerned about the possiblity of
+transmitters being received by the aircraft antennas and thus interfering
+with routine communications. That's why sometimes, where the pilot is given
+the discretion, you might be allowed to use your H/T after a test trans-
+mission. The flight engineer can tell if any interference is present.
+
+I know (not just heard) four pilots who routinely use H/Ts while flying.
+If it doesn't make them nervous, I'm not going to let it bother me.
+
+BTW, the last time I followed a similar thread in comp.laptops, no hard
+evidence was presented that any laptop computer had ever interfered with
+any flight operation. The FAA is one of (if not _the_) biggest CYA
+organization in the world. And rightfully so! If they had evidence to
suggest a direct cause and effect relationship you can be sure that the only
way any of the electronic goodies we love would get on-board would be with
batteries out, even in checked baggage.
+

This discussion takes place periodically in several news groups regarding
aviation, telcom, shortwave and ham-radio. There is always someone who
says "prove that my (insert favorite electronic device) causes interference
to aircraft navigational equipment". These persons are always willing to
bet your life that their equipment will not interfere.

The fact that a pilot uses an FM radio in his own aircraft does not prove that all FM radios are safe for use in all aircraft. If the FM radio were to cause interference, the pilot, knowing the radio existed, could simply reach over and turn it off. This is not the case when source of the interference is in the back of a commercial airliner and is unknown to the pilot.

Because denial is such a large part of human nature, the FAA has specifically regulated that the carrier (read airline) and not the pilot must certify that a specific device will not cause interference to a specific aircraft configuration. Someone has already posted that regulation.

Following a lengthly discussion in the telcom group where one individual insisted that nav receivers are so thoroughly tested that they just cannot be interferred with, I contacted Al Peterman, who is an avionics technician at a local FBO, who replied:

:From: al@qiclab.scn.rain.COM (Al Peterman)
:To: nosun!tektronix.TEK.COM!vice.ICO.TEK.COM!georgep@nosun.West.Sun.COM
:Subject: Re: Avionics Interference
:
:Yup. I've steered a 182RG and the Cardinal by tuning a FM receiver at the
:10.7 Mhz IF frequency differential and having the autopilot coupled to the
:Nav radio. In other words, tune the VOR to say 115.7 and the FM radio to
:105 and the radio's IF oscillator WILL affect the nav and the CDI display.
:
:I'll see if I can pick up the thread on telecomunications and post this there
:also..
:
:Now as to interference from PC's - not proven to interfere, but cellular
:has enough radiated power so I'd suspect receiver overload. Since cellular
:is up at 800 Mhz it might not interfere with the UHF nav, but I wonder about
:the DME and transponder at 1000 Mhz..
:
:Alan L. Peterman

The fact that Al could steer his Cardinal using an FM radio is proof enough that electronic devices should NOT be used by the general public in commercial airlines.

2829. DX Bulletin

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-17 18:35:37 UTC
From: skitch@NADC.NADC.NAVY.MIL
Message-ID: <9109171835.AA19739@NADC.NADC.NAVY.MIL>
Source record: 293401

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 027 (OPDX.027)
September 16, 1991
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn Packet Cluster Network, DL4MFM, NT2X, W8KKF, OH0XX, K8YSE and W0JRN for the following DX information.

3B7, ST. BRANDON. Jackie, 3B8CF, continues to be active as 3B8CF/3B7. He has extended his stay for about another two weeks. QSL to 3B8CF, Seewoosankar Mandary, Shastri Rd., Candos, Quatre Bornes, Mauritius Island.

4U1VIC. Mario, DL4MFM, informs OPDX 4U1VIC will be activated during the CQ World-Wide DX SSB Contest. There will be 25 operators from the RRDXA.

J8, ST. VINCENT. W8KKF, KP2A, WX9E and WA8LOW will operate J80D in the CQ World-Wide SSB DX Contest October 26th and 27th. Each operator will sign J8/callsign two days before and one day after the contest. Operations will be on 160-6 meters including WARC bands. QSL as announced.

S2, BANGLADESH. Erik, WZ6C, was reported active again as S21NQ. He was heard on 14002 kHz on September 13 at 2323z for about one hour and again on September 14 at 2330z. QSL via W4FRU.

ST0, SOUTHERN SUDAN. Dennis, ST0DX, continues to be active and was found on 18115 kHz around 1730z handing out stateside contacts. He has also been active on RTTY, check 21083 kHz around 2030z. QSL to WA2NHA.

UH8,UI8, TURKOMAN & UZBEK. Jim, W0JRN, informs OPDX that Vlad, UA4FDS, and Paul, UA4FEG, will be making a stop in UH8 and UI8 sometime in October for two weeks. They plan to operate CW and SSB on all bands, except the WARC bands. They will probably use their callsign /UH8 and /UI8. QSL UA4FDS to VLAD ZAYTSEV, P.O. Box 555, Penza 440061 USSR. QSL UA4FEG to Paul Bogachev, P.O. Box 222, Penza 440011 USSR.

XQ, SAN FELIX. Pedro, CE3BFZ, reports that John, XQ0X, will be active again from San Felix in October. Micki, CE3ESS, has finished all the U.S. cards for XQ0X for his last operation and is now working on the cards for Europe. Few of the cards have gone astray so if you do not have your cards in another month or so, you may want to submit again.

XW, LAOS. Sig, JA5AHH, is now signing XW5AHH and was heard in Ohio on 17 meters at 1600z working Europe and Japan, but he completely missed the brief stateside opening. QSL to his home call address. XW8KPL was also active September 12 on 21264 kHz around 1815z. UPDATE! Just before going to print, I was told Sig has left XW and he will be active now for 3 months in Thailand.

XZ, MYANMAR. XY0RR operation ended September 11. According to Ed, NT2X, approximately 50,000 contacts were made. Operations did not take place at the planned island site, but rather from the Golden Triangle. NT2X wants to remind everyone he is NOT the manager for the XY0RR. QSL go to Romeo Stepanenko, P.O. Box 812, Sofia 1000, Bulgaria.

YA0RR QSL CARDS UPDATE. John, K8YSE, had a phone conversation with Ed, NT2X, on September 11. According to Ed, the QSL cards for YA0RR that were printed in Japan never arrived in Moscow. Half were sent by air and the other by surface mail. Ed suspects that the boxes are being held in a Soviet customs warehouse somewhere. The only cards that have been sent are the ones that were printed by W4MPY here in the USA and there are no more of those cards left. Hopefully, the cards will be found for processing and then mailed.

ZA, ALBANIA. A reminder that several well known DXers are on their way to ZA-land to train the Albanians in the fundmentals of amateur radio and should be operational by the time you read this bulletin. More information came out this week from a press release by OH0XX. The initial group and the following sub-groups are traveling to Albania without a visa. Special arrangement have been made by the Albanian government. There were 8 complete stations with multiple beams and amps (all donated to the Albanian government). All equipment has arrived safely in Tirana and are in storage at the PTT facilities. Other operating areas such as the low bands, six meters, and RTTY have been discussed with the Albanian authorities and they seem to have no objections. "Their main goal is providing at least one initial contact with every needy DXer. This will be given preference over multi-band requests." (Excerpts from ZA Press Release #3)

ZK1, NORTH COOK ISLANDS. SM5BOQ is operating as ZK1OQ on 7003 kHz at 0445z, 14200 kHz at 0500z, 17/12 meters CW and SSB around 1800-2100z. He will leave the island September 25th and then become active from American Samoa as KH8/SM5BOQ. After KH8, he will travel to Niue and sign ZK2OQ. QSL to his callbook address.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

I think that perhaps a survey of service problems would be
interesting prior to ordering any new rig. Our local Minnesota
choose to drop the Alinco line based on service and factory support
problems.

I had a similar dilemma in choosing between the KW 950 and the
FT1000. One of the main reasons for the choice I made was that
I had good local service. BTW, I choose the FT 1000.

John, N0ISL (and a buncha other calls)....

2831. 2m Antenna

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-17 18:35:58 UTC
From: aviator@athena.mit.edu
Message-ID: <1991Sep17.183558.28785@athena.mit.edu>
Source record: 293399

I'm considering buying the Cushcraft AR-2 Ringo antenna. This is an older design compared to the ARX-2 Ringo Ranger and ARX-2B Ringo Ranger 2B. However, since I want to use it for both 2m and CAP frequencies (which are just above and below the 2m amateur band), I think I want the greater bandwidth provided by the AR-2.

My questions: Are there any other antennas I should consider with similar characteristics (omnidirectional, 3.75 dB, small, < $40, SWR 2:1 10 MHz bandwidth). Or should I not worry about the bandwidth so much?

Thanks...Joakim (still getting my feet wet)

>73, Paul AA6PZ

Sorry, Paul, but Gary is right. I don't have the equations handy, so can't
quote any numbers, but any grounded, conductive "hole" will form a waveguide
beyond cutoff low pass filter. The cutoff frequency is a function of the
length/diameter ratio, and typically has to be rather long in relationship
to the diameter to have usefull charastics. Most good books on shielded
rooms will have some discussion of this type of filter since it is used for
many of the penetrations of the shield walls.

I'm not an expert on shielded rooms, but did do enough work in the EMC/EMI
testing area to know that these filters do work.

The resistance of 10 feet of #16 zip cord is about .08 ohms. Even if you assume the speaker impedance is substantially less than nominal at low frequencies, it's hard to believe that a couple percent additional resistance will have a significant effect.

Skin depth in copper is about .018 inches at 20 kHz, .33 inches at 60 Hz. Since #16 wire has a radius of .025 inches, the resistance will not be affected at all at low frequencies, and only slightly at 20 kHz.

"Monster cables" are of value only to the profit margin of audio stores.

>have had any experiece with these antennas please send me E-mail. I will
>summarize and post if I receive enough replies.

I know you said to EMAIL, but I feel the urge to warn off anyone who plans
to waste money on these things. I TRIED to use the 80 meter version once
on Field Day a few years ago. Others had tried to operate 75 meters, but
had given up because the "band was dead." Sure enough, all the signals
were weak in the receiver, and when I tried to transmit, I could only work
the 3 or 4 loudest signals on the band. I then disconnected the outer
conductor of the coax and loaded up the COAX as a crude vertical antenna,
using an antenna tuner. Signals jumped up many S-units, and I was able
to operate normally the rest of the evening.

The manufacturer claims these things are equal to a full-sized dipole.
This is absurd on the face of it when you consider that an antenna of
this size (a meter or so, as I remember) would have a radiation resistance
of no more than a few hundredth's of an ohm on 80 meters. The loading
coil doesn't use particularly large wire as I recall, so you know the
losses must be many dB.

>

A friend of mine had the same problem when the ballast tube in his
390 went open. We figured that a fixed resistor in series with a
PTC thermistor, all in parallel with another fixed resistor should
do the job. It would start with a low cold R and go to a higher hot
R as the current went up. We never tried it because the mfg. of the
the ballast tubes was very in business and quite aware of their
popularity. They even reduce the government price if you tell them you
are not a business and only buy a couple. Please don't quote me
(it's been 2 years and I didn't buy them) but I think the govt. price
is about $120 and they sell to you for $40. Quite a deal, considering.

>
> Thanks

Here is a collection of the mods. Enjoy folks, and thanks for the help!

For crossband repeat, just set up each band with the mode which
you want to use, and then hit <function>2 <function>ENTER - To cancel
hit <function>2 <function>ENTER again.

-fred
--
| Fred Lloyd AA7BQ Fred.Lloyd@West.sun.com |
| Sun Microsystems, Inc. ...sun!flloyd |
| Phoenix, AZ (reality -- what a concept!) (602) 275-4242 |

This is less of a mod than it is a function. To expand the receiver
frequency range of the new Icom IC-W2A to 118.00-170.00, 322.00-513.00,
and 800.000-970.000, do the following:

o Hold down the Light, B, and # keys while turning the power on.

That's actually a four button sequence, since power on is controlled
by a keypad button.

Internet: ...ubbs-nh!wa1omm!paul CIS: 70411,626 PLink: UPPERCRUST

Modification Instructions for the IC-W2A Handheld

Two mods, one for Cross Band Repeat and one for extended TX range

Cross Band Repeat Function

To access the cross-band repeat function, first perform the extended receive mod by holding down the Light/B/# keys while turning on the power.

To enable cross-band repeat, set each band to the frequency and mode desired. Set the current band to VHF.

Press (Function-2) (Function-Enter) and the little "L" indicator will flash. The radio is now in the cross-band repeat mode. Do disable, press (Function-Enter) again.

Extended Transmit Mod

Call the ICOM parts department ((206) 454-8155) and order a pair of MA133 diodes (P/N 1790000850). These are the three terminal surface mount diode packages. It is probably not advisable to substitute conventional leaded glass diodes here due to size restraints.

The modification involves removing one surface mount component and installing two others. The working parts are extremely small and the mod should not be performed unless you are comfortable with working while using a loop eyepiece or other magnifying device. This is a "surgical" operation. Take all the usual precautions with respect to static electricity, etc.

Remove 5 screws holding back on, and two screws on side of case below the PTT switch. Gently pry the unit apart.

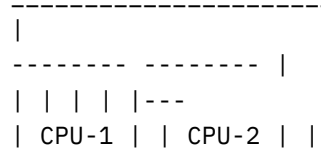
Inside the unit are two RF "stack" units. The complete RF "stack" is composed of two enclosed sheet metal boxes sandwiched together, about 1.5" wide, 2" tall and .5" thick. Each RF stack unit (one per band) is totally self contained, is about .25" thick, and plugs into the "motherboard" using connectors mounted on one end.

First, remove the stack units. To do this, remove one screw from each side of the stack. Remove the single screw off the bottom end of the stack and gently remove the metal spring clip holding the stack together.

Carefully lift each stack unit out by pulling it back and down. They should easily unplug from the upper motherboard. Set them aside for now.

At this time the back side of the front panel is clearly accessible and the two CPU's are visible side-by-side across the top. Now refer to the following illustration:

Top of Radio, Back side of Front Panel



```
| | | | | P |
-------- -------- | T |
| T |
-------- | |
-------- |---
.<: <-D1 ---------- |
.. | |fuse | | |
D2-> V ---------- |
.. |
D3-> V |
.. |
V <-D? |
|
```

D1, D2 and D3 are locations on the board. Only D2 is installed
at the factory. To perform the mod, you must do the following:

Remove D2
Install D1
Install D3

The locations of D1 and D3 are clearly silk screened onto the circuit
board and are easy to locate. Don't attempt to re-use D2. The periods
(..) show the approximate location of the solder pads for the 2-legged
sides of the diodes.

Diode D2 may be removed by carefully heating the leads and prying it up
using a sharp tool. Be very careful since it's easy to lift the solder
pads.

One method of installing diodes D1 and D3 is to use a very small drop
of super glue to mount the part, and then use a soldering iron to tack
down the pins.

After the parts are installed, reassemble the radio. Although the
manufacturer recommends that the microprocessor be reset after this
mod, I have found it to be unnecessary. All memories retained their
settings after the mod. Tests using a dummy load and a frequency
counter showed TX ability on UHF from under 400MHz to over 490MHz.
TX on VHF covers from 136MHz to 174MHz.

-fred AA7BQ

--
| Fred Lloyd AA7BQ Fred.Lloyd@West.sun.com |
| Sun Microsystems, Inc. ...sun!flloyd |
| Phoenix, AZ (reality -- what a concept!) (602) 275-4242 |

Now for the added part - multi-digit entry for mhz

After doing the above, REQUIRED!!

select the VHF band as MAIN
push F (above the PTT button) and SET (the 8 button)
then using the ^/SCAN button make the lower right symbol of the band say PL
rotate the right knob to set the display to 1,10, or 100 as desired
1 sets entry to single digits only
10 sets entry to 10's and single digits
100 sets entry to all digits

hit PTT

Now - repeat the above for the UHF band - Note It WILL NOT work unless you do it for BOTH bands.

You now have a walkie that requires all the digits (assuming you chose 100) to program it's frequencies.

/s/ Bob Gettys N1BRM

Rupert,

Here is more info on the the performance of the W2A after the mod.

John. N0LHW

Well folks I have had my IC-W2A for one week now & am,needless to say
suitably impressed. But now my comments...
Why did Icom have to change the DC input socket to what the W2A has.
It is very unusual & as far as I can find out, Icom are the only people who
can supply a plug for it. I think they should have stayed with the more common
2.1mm DC jack as per the IC-32AT.
I did some checks of the receivers using an IFR 500A signal generator
& the following is what signal level I needed to get 1 "S" point on the W2A's
S meters.
At 70mhz, 1mV (milli-volts)
80mhz 0.5mV
90mhz 0.25mV
100mhz 75uV (micro-volts)
110mhz 1.5uV
From here to 170mhz less than 0.2uV
173mhz 1.5uV
174mhz 75uV
200mhz 75uV
250mhz 0.5mV (whats going on here???)
275mhz 4uV
300mhz 1.5uV
320mhz 5uV (changed to UHF main VFO from here on)
400 - 450mhz less than 0.35uV
460mhz 0.75uV
465 - 510mhz less than 1uV
520 - 690mhz less than 2uV
700 - 999mhz varies from 7.5uV to 2uV, dips to 0.35uV at 900mhz.

Quite impressive, but I would really like to get better sensitivity
at the 70 - 80mhz end. Studying the circuit diagram shows bandpass/bandstop
filters all over the show, so maybe its possible to modify a few to increase
sensitivity here.
I am gathering together the ciruits of the Icom IC-R1, IC-24AT &
W2A to compare the front ends so we will see what comes of this experiment
in the near future.
One other worry was the on/off switch, how do you turn the set off
when the battery is flat. I am concerned about running the battery to zero
volts, hopefully this does not occur. I have been disconnecting the battery
when charging to prevent anything funny happening.
The antenna supplied with my W2A is an FA-1443BB, whats the difference
between this & the FA-1443B, & the FA-4B supplied with an IC-R1.
One more gripe, I dont like the plastic plug/covers over the DC jack,
headphone, external speaker sockets, they should have been rubber as per the
IC-32AT, as I can see already that they will not last very long after prolonged
use. Boy what a moaner, you say, small complaints but this would really have
made it the best. I wonder what Yaesu & Kenwood are going to do to compete
with this???

Cheers

Subject: Re: Request: rig; Topic: icom_ic_w2
Status: OR

Thanks For The IC W2A Mods.
The extended receive that HRO Oakland gave me differs slightly
from the posted version...my display (sensitivity is another
matter) indicated RX from DC to somewhere just below IR after:
turn off
simultaneously press-funct-3-B-# keys
turn on

(end of mod)
It has been pointed out that only the funct is different from
previously posted version, but I wonder. I get the feeling that
there are many more hidden tricks to this rig that only ICOM
knows about. I'd really be curious about any kind of data transfer/

cloning capabilities it may have, etc.
-73 de Michael Dahl
KC6UFR
e-mail: admitq@violet.berkeley.edu

A couple of weeks ago I posted an inquiry about bad transmit audio in a IC-W2 handheld. I would like to thank everybody who sent in their response.

Some said their radios work well, one said his doesn't and one told Icom America had repaired similar symptoms in his friend's radio. A later comparison with a healthy unit confirmed that the fault wasn't between the operator's ears...:-)

However, Jukka, OH2BUA, a good friend of mine happened to work me with his brand new IC-2SRE. He had audio characteristics astonishingly similar to my radio. As a result to my complaints he opened his radio and cured the problem. Last Monday I did the same job and here it comes:

---------- W A R N I N G ----------

Servicing your radio by yourself may void the warranty. The author takes no responsibility whatsoever of the possible hassles with warranty codes intended for technically non-experienced radio users.

If you are not a qualified radio service technician on if you are not accustomed to work with extremely miniature surface-mount components, return your radio to the dealer with the following instructions.

---------- W A R N I N G ----------

Radio: IC-W2A/E, IC-2SRA/E, IC-4SRA/E

Trouble: Weak transmit audio, deviation below the specifications, high end of the speech spectrum missing.

Tools needed: A good soldering iron with a sharp tip, desoldering braid, solder, sharp-nosed pliers, small cross-point screwdrivers.

Cure:

1. Open the radio case following the instructions in the owner's manual (p. 45).

2. In radios fitted with the UT-63 board, pull out the board.

3. Unscrew the two small screws holding the tin plate against the bottom ends of the band modules. Pull out the plate.

4. Pull out the band modules.

5. Now you see the microfone fitted to the mother board. It should fit neatly against the inside of the fascia panel. If it doesn't, carry on.

6. Unsolder the microphone leads from the mother board. BE CAREFUL not to overheat the board and the wire insulation.

7. Pull out the microphone and the rubber gasket.

8. Re-install the gasket. Pull in the microphone so that it fits inside the gasket well and press it firmly to the end.

9. Re-solder the mic wires.

10. Install the band modules, the tin plate and don't forget the screws.

11. Replace the rear panel.

12. Tighten the 7 screws.

13. Test the audio response.

(c) OH2BUA and OH3BK, 1991. Unlimited reproduction allowed.

The info I would like is a reasonable source for either the R1 (especially) or the R-100. My latest ICOM brochure says that both are not for sale in the USA or Canada. How do people that do buy them get them worked on in the USA (do you ship them back to Japan or to England?)

2840. Antenna in Attic

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-17 20:48:55 UTC
From: sdkuo@argo.acs.oakland.edu
Message-ID: <9904@vela.acs.oakland.edu>
Source record: 293411

I have a question concerning mounting an antenna in an attic.
How practical is it to mount a VHF/UHF antenna (such as a discone or
dualband dipole) in a house attic? I live in a 2 story house and roof
mounting is kind of difficult. How much loss can I expect for receiving
and transmitting in the VHF, UHF and 800MHz range? I plan to use this
antenna mainly for receiving (scanner) and some transmitting (2m/70cm).

Steve Kuo, N8OPH, sdkuo@oakland.edu

2841. IC-W2A sub-audible tone/ cross-band repeat

From: thayes@romulus.rutgers.edu
Message-ID: <Sep.17.16.54.05.1991.5038@romulus.rutgers.edu>
Source record: 293406

Does anyone have any info about the inability of the W2A to use "PL" sub-audible tones while it is in cross-band repeat mode?

Is this a normal problem caused by the programing of the radio or did I just mess up my radio?

If it is part of the radio's programming is there any way around it?
Also is ther any way to use "PL" on both bands?

A very effective telephone filter can be made with two 470 microhenry chokes and two 5000 Pf capacitors connected as a Pi filter, inserted in series with the phone cord as close to the phone as possible. The parts are available very reasonably from AG6K. An easy way to install the filter is to just cut the cord and splice it in, covering everything with shrink tubing. Beware of coiled and flexible cords, though, because the wires in them are very difficult to solder. For wall phones, the filter has to go in the wall jack, or inside the phone. One could add a second filter section in really tough cases, but I have not found a case where that was necessary.

The Radio Shack split cores won't help telephones much, but they have been very useful in solving other RFI problems. The trick is to wind at least 6 turns around the core. Just putting the cord through it once won't help much. Most simple audio systems, for example, can be made relatively RFI-proof by putting one core on the power cord, and one on each speaker lead, with 6-8 turns around each. I had to put one on the power cord for my answering machine, in addition to the phone line filters.

(I live in an urban area, run a kilowatt, and operate contests, so I'm getting a lot of experience fixing RFI problems.)

> roofline, and damned few that allow any at all. Choice? What choice?

Well this is starting to get a little far afield but I will take it out some more. I am a homeowner in Houston which does use deed restrictions and covenants as a form of zoning. Although it is possible that zoning is coming to Houston, right now the deed restrictions are the only way in which any type of control can be kept over uses of property in a neighborhood. For this reason, all deed restrictions must be enforced or a subdivision takes a real risk of loosing the whole set. This has happened in some subdivisions and has been used by speculators to destroy a neighborhood.

I have no problem with my neighbor erecting an antenna [as long as it is done correctly] but I would have a problem with my neighbor starting a car repair business on his lawn. AS far as the law is concerned, however, both cases are identical and unless you prevent the former, you can't prevent the latter. In fact, we have had a very interesting fight going on in the legislature over home care providers. Under most deed restrictions, it is illegal to have a day care center [< 8 children] in a private home. There was an attempt to exempt this type of business from deed restrictions and resulted in a very nasty fight.Deed restrictions won.

AS an aside, there really are some interesting restrictions. In my subdivision we cannot put any yard signs up except for a sinle for sale sign in each yard. This includes the signs from Hal's Roofing or Foundations'R'Us. We also are not allowed to have garage sales and must keep up our lawns.As far as I know, the only illegal restrictions are racial and religious. There are still in the legal documents but there is a disclaimer when you record that they cannot be enforced.

->
-> I doubt that you would have to go to this extreme. The whole tube
->compliment that runs off the ballast only draws 300 mA. Besides, the
->balast is nothing more than a hot wire resistor anyhow.

Well, yes and no. The ballast works because it has a positive
temperature coefficient (e.g., as it gets hotter, the resistance
increases and reduces the current flow). An ordinary resistor would
work, but would not regulate.

Besides, for $1 in parts, I can build an AC current regulator that
should outperform the ballast tube. With ballast tubes going for $15
and up (when you can find them), this is a real bargain.

I called ACE the other day (800 number) to see if I could order a mechanical leaf counter replacement (the front tuning rotary switch) as it seems to be reliable in one direction but intermittant in the counterclockwise direction. The lady who picked up the phone said "yes, we have thse in stock and will ship you out one today".

We will see, but my initial parts request was handled well. Actually, I ordered a full service manual for the AR3000 eight months ago and was treated very well also. The service manual arrived within 3 days and very complete... All for the AR3000 scanner/hf receiver...

I bought an Icom R1 scanner from Grove Enterprises. After using it
for about a week I returned it for a full refund. Below is a review
by Michael Martin from the Scan Atlanta Bulletin Board (404-763-4369).
His comments pretty much sum up what I thought about the radio.

==========

ICOM R1

After many weeks of playing around with my newest toy, the
ICOM R1, I've decided to give it a review that will help others
who are interested in purchasing this radio.

The radio arrived in a box containing the basic radio, a VHF/UHF
wideband antenna, belt clip (which you have to screw on yourself),
earphone, battery charger and instruction manual.
The first thing you must do is put the radio on charge and let
it sit there for approximately 15 hours (as this is what the
manual suggest to get a full charge). During this charging
period is a good time to sit down (find yourself a comfortable
chair or couch) and start the LONG process of reading the manual.
At first, I figured you had to have a PhD from MIT to understand
half of the functions this radio could do, but after a while,
some of it made sense.

Once you have fully charged the internal batteries (which are
virtually nonaccessable) you are ready to start operation this
scanner. There are three separate knobs on the top. The
power/on/off is in the center and the squelch is on the left.
The location of the squelch knob and the positioning of the
BNC connector for the antenna are so close together it makes
it difficult for anyone with large hands to operate this knob.
You turn on the radio and it will come up on Memory channel
number 0 (yes, channel zero). The radio goes from 0-99. Now
comes the hard part. In order for you to program a frequency,
you must first move it to the "clear" format before you can
enter it. This is accomplished by depressing the Function key
on the left side of the radio while pushing the "CL" key simultaneously.
Once in the clear mode, you enter your frequency, what mode
you want (am, fm or wfm) and then ENTER.
Now you must again depress the function key and then the "mr"
key to get it to accept it. After awhile, you will get use to
this procedure, if not, you will have a whole lot of blank
channels to choose from.

To get the scanner to scan is another MIT graduate procedure. This radio does NOT have "banks" to it. You have to select what channel span you wish to scan. This means if you want to scan channels 0 thru 15, you have to go into a setup mode and enter the upper and lower channel limits. YOU CANNOT SCAN DIFFERENT LIMITS OF CHANNELS SUCH AS 0-15, 25-30 AND 90-99.
If there are frequencies in those other channel limits you wish to scan, you will have to move them to channels in a continuous run with your base limit. If there is a channel within your bank that you do not wish to listen to, you cannot simply hit the lockout key to get rid of it as this radio does not have one. Instead you have a "mask" button which will completely remove that frequency from your radio! Once you have gotten your radio set up to scan which ever channels you want, you look for the normal scan button, but there isn't one. Again you have to go to the function mode and then depress the P Scan key. You can set up the radio with either a 2 or 10 second delay (not individual channels, but for the whole spectrum. Now most radios when you lock up on a frequency, you simply hit the scan button again and it continues. Not here. The third know on top of the radio is you resume scan button. Turn it clock wise, and it scans in a ascending order (0-15). Turn it counter clockwise, and it scans in a decending order (15-0).

As with the Radio Shack Pro 2004-2006 scanners, you have the ability to have 10 different memory scan banks. These are accessed by getting out of the "MR" mode and into the clear mode. Here, again, by using the function mode, you can operate each of these banks. This radio has the ability to scan in increment of 0.5, 5, 8, 10, 12.5, 15, 20, 25, 30 or 50 kHz steps, both manually and in scan mode. You can also change the frequency by 1, 10, 100 or 1000 mHz by selecting the Dial Set mode.

There are many other "options" that can be found on this radio that are only found on the top of the line Mercedes. The radio has a built in clock (either 12 or 24 hour), a power saver mode (which will actually shut the radio down after a while), a timer which you can set to turn off the radio like a time on the TV, a receive light that comes on when there is a signal being received (but can be deactivated to save battery power) and it even has a built in "S" meter. Also, there is a nice light that lets you see your frequency at night or in the dark.

Performance:

The R1 starts at 100 kHz and goes all the way to 1300 mHz. It will only receive signals in AM, FM or NFM. There is no CW or Side Band selectivity. If you wish to monitor any signal below 30 mHz, you must use an antenna other than the one supplied. I actually work within 1 mile of the WSB-AM 750 transmitter and when I tune in their frequency, I can barely hear it. The supplied antenna does, though, work rather well on 30-500 mHz.

Performance decreases severely on anything over 500 mHz.

The internal batteries are good for about 5-6 hours of monitoring, 3-4 if continuous carrier.

Adjacent signal and birdies are horrible. The birdies seem to pop up where you would least expect them. The VHF Hi band is full of them and the UHF has it's fair share. When you get into the 800 band, especially around the cellular frequencies (of course I would not monitor that as it is a violation of Federal law), you can start to pick up a signal as far away as 300 kHz!

Recommendations:

Over all, the R1 is not that bad of a radio (as long as you have your degree in physics), but I cannot give it a bad grade as I haven't been able to compare it to the AR1000. There are many features I would like to see incorporated into this unit as well as many features I would like to see deleted from it. A simple lockout key, bank selections and easier instructions. ICOM would do good to get rid of the MULTIPLE functions it takes to operate this radio.

Necessary Accessories:

Depending on your listening habits, if you stick to one particular band, get an antenna for that frequency range. A good quality carrying case instead of the flimsy light weight leather case you can order. AN EXTERNAL BATTERY PACK IS A MUST! Opt for the ICOM BP 83, 84, or 85. The internal batteries are rated at 300 ma. The BP 83 is 600 ma, the 84 is 750 ma and the 85 is 1000 ma. When you purchase the battery pack, you MUST get a new charge with it. The supplied charger is rated at ONLY 50 ma and WILL NOT charge an external pack. You can purchase a 500 ma charge at Radio Shack for as little as $10.94 (RS part 273-1652), but the only draw back is that the ICOM radio uses a sub miniature type plug and the Radio Shack charge has a miniature only (I solved this problem by cutting off the plug off the ICOM charger and splicing it on to the RS charger). This will save you alot of bucks as I believe the 300 ma charger from ICOM runs about $35.00.

Conclusions:

Would I buy this radio again if I had to do it all over again? I really don't know. As I said earlier, I have never had the opportunity to compare it with the AR1000, but would like to. This radio is not for the weak at heart. There are many good points to it as is an equal amount of bad. Be prepared to study the manual inside and out as well as many hours of frustration trying to figure it out. ICOM could have done a better job of this radio, and who know, maybe they will introduce a R2 one day that is better.

This doesn't make sense. The visibility of Salyut in a given part of the world
is not going to depend on when the cosmonauts launch. It could be that they
wanted the natives to see the Soyuz, though. The main factor in scheduling
Salyut (and, I would assume Mir) launches is that you want your recovery area
to be in daylight when you plan to recover. There have been 1 or 2 suspected
six month missions which have been aborted because the Soyuz could not dock
with Salyut; the messy part about these is it makes your recovery area dark.
(Of course, the Soviets claim that their original intention was to practice
emergency night recoveries :))

The visiting missions are only onboard Mir for roughly one week. While the station will _eventually_ be visable to all parts of the world (below, say, 70 deg. latitude...), this will not necessarily occur while the visiting mission is onboard. The time and date of launch was (apparently) chosen to coinside with the Mir station being visable in Cuba or Viet Nam.

Dear All,

Re: HTs on airplanes.

1) Could the maintainer of the FAQ please copy the relevant FCC rules into it? That way we can refer people to the FAQ rather than rerunning the debate here at regular intervals. Basically
2) Personally, I don't give a flying Philadelphia aardvark what all these self appointed EMC experts think. If there's the tiniest, weeniest, slightest, minutest, vague, imperceptible, unmeasureable chance that your radio equipment is going to interfere with the safe operation of the aircraft, I don't want you on the same airplane as me. I don't want you in an airplane that flies over me. I don't want you in an airplane that's anywhere *near* me. In fact, I don't want you in an airplane at all.
3) The Lockerbie "disaster" was caused by the detonation of 11 ounces of Semtex explosive contained in a Toshiba radio-cassette recorder. Stop bitching about the security at airports, except if it's too lax, in which case complain to anyone who'll listen. Be nice to the security people. Take the batteries out of your electronic equipment. Be prepared to demonstrate that equipment is operable. Which would you rather; Some minor inconvenience at the airport, or been blown into small pieces at 20,000 feet?

73,

Hugh, G0CNR.

Via an ethernet card or via appletalk? I understand it can not be done via
appletalk.

I too placed an order with ACE yesterday (9/17) for the AR1000XC. Their customer service person was very nice and I was treated well. They said they were expecting more units within 2 weeks and that I would have mine by then (WE WILL SEE!). After I receive it, I will post my comments and observations on the AR1000XC to the net. What the heck; they give you 25 days to trial it!

Every shuttle flight, we hear how it was visible here or there and we get
posts which predict when it will be visible which arrive AFTER the time of
the prediction. For the next flight (or for MIR) could some kind expert
post viewing predictions a little more in advance? Thanks.

It doesn't take much signal to cause the ILS receiver's phase detector to deviate by a couple of degrees. The error is subtle and continous so the pilot may not notice. Landing 50 feet right of the runway is painful though. With signals external to the aircraft, the variation is rapid and temporary, easily noticed by the pilot.

Most modern aircraft have several systems onboard to allow cross checking, but there are still a lot of older aircraft flying with WWII era electronics.

Locally, several of us jokingly call the Ringo the Cushcraft Dummy Load. This antenna is not in the same class with a good antenna like the AEA Isopole, or a great antenna like the G7 or one of the Comets or Diamonds. It is cheap and small however.

You can make a better antenna with a coat hanger and a SO239. And it will cost you even less. If you do buy one, stop by your local electrical supply house and get some NoAlox and liberally coat all joints. The Ringo tends to corrode rapidly.

That Chapter is included in the manual for almost all Military Communications gear. It explains the fine art of using:
a) an AXE
b) gasoline
c) plastic explosives
for preventing the enemy from using any gear that has to be abandoned in place during a strategic withdrawl. :-)

What is/was the Hallicrafters S-39? A not-so-good tube-type protable in a rather large (6"x8"x14") steel box. The batteries occupied about half the box, and were eaten quite rapidly. It covered 540 kHz to ~30 MHz, with performance similar to their bottom-of-the-line Skybuddy / S-38. All in all a curiosity, not a prize in my book. I had one for a while about 10 years ago.

Pardon the tpying !!

Bob,
I've had an R1 for about 6 months now and I like it a lot. I originally had
a BC-200 but sold it to get the R1. Mine came directly from Japan through
an importer so I have a copy of the English manual. They are available in
the US now and

As brochures have said, it covers 100kHz to 1300MHz continuous and the audio
quality is good for the piezo-electric speaker in the unit. I usually use
an external speaker or headphone if I use it in the car (I have a convertible
Jeep so the interior noise level is high). The LCD is quite readable and
is backlit (either continuous or for 5 seconds each time you hit a button).
The priority channel is programmable in the sense that it isn't a memory
channel but is a VFO freq. There is a scan mode that will allow you to
scan successive memory locations and look at the priority freq between scans.

There are other features such as 10 scan ranges with separate mode and
tuning step assignments, 100 memories which are used for normal scanning,
skip programming (both auto and manual), and auto-write scanning. In range
scanning, if the SKIP button is pressed, the freq is written
to mem locations 79 and go down from there. When the skipped freq is scanned,
any activity on it will be ignored and the scan continues (unlike the BC 200
where the memory loc is not even scanned). In memory scanning, that mem loc is

marked as "skip" and won't stop if active. There are several other scan modes such as mode (AM, FM, WFM) scanning and auto-write (active freqs are written to mem locations 80-99). I rarely use the Auto-write mode due to a problem mentioned below. Probably the best feature I like is it's size.

As far as negatives, the unit does suffer from low selectivity in that it tends to stop scanning many kHz away from the actual signal if the transmitter is close or strong. I would hope that if they are selling as well folks say they are, maybe Grove or someone will come up with a mod to fix this. There is a company in the UK that will do such a mod but based on reports from the net, it doesn't sound like a good idea (several months turnaround, one unit returned was broken, cost about $120-$150 including shipping, etc...).

All-in-all, I really like the R1 and don't regret selling the BC one bit. I'm also a Ham and had purchased an IC-2SAT transceiver over a year before I got the R1. I have an external battery pack that I used on the SAT which fits the R1 (good thing too, since the R1 doesn't give you much warning once the batteries get low, the external pack keeps it going for at least 6 to 7 hours). It's real handy to be able to put the thing in your pocket and go anywhere without worrying about a bulky scanner hanging on your belt (no more "I hope I don't look like a geek" syndrome). I would recommend getting it if you are trying to make a decision. If you have any other questions about it, feel free to send email.

I had my discone in the attic for a while and it worked OK. I would
have to guess but I PROBABLY noticed about a 3db gain when I finally
mounted it outside up on the roof. If you really want to keep your
antenna away from the elements inside the roof and you are fairly
close to the signals you want to hear, you should have no problem.
I also have a home made 6 meter 5 element beam in my attic and it
works well enough for me that I have left it in the attic.

As I recall, the last resort was: bang the hell out of the gears that are so plentiful under the hood.

I rememeber this from a visit to Synton (U. or Illinois ARC) in my pre-ham days. I was a novice SWL but I already had some idea of the R-390's reputation. Well, there were two 390s stashed under a table at Synton *not even being used*! The big leagues! :-)

BTW, where is Synton these days? As I recall, the old shack behind the EE (?) building was evacuated a few years ago. How 'bout the old twin towers? I imagine they're history. :-(

It's really funny. Typical militarese. Something like:

a. Smash. The front panel, tubes, gears, filters. Use axes, hammers
crowbars, picks.
b. Bend
c. Burn
etc.

But be sure you have permission from your CO first!

This sounds a bit too mich like 'modern mythology'. You can't 'steer' a
plane that way, you could only disable the VOR reception and if the
autopilot doesn't detect that, get a real one. Also the part 15 requirements
are so tight in the 108-118 NAV range that it should be almost impossible
to find an FM broadcast reciever with the local osc. on the high side.
Same way, almost all scanners and air-band receivers have the local osc.
on the high side in the 118-136 range to avoid the NAV band.

DON'T use your radios on an airplane. DO learn how things work.

Hmmm,

The cell phone companies have strong lobbies, and can trample citizens
interests with ease ?
The only group of people they respond to are their customers. The problem
is that the customers do not yet know that existing phones transmit "in the
clear", that zillions of receivers exist that can listen in, and that many
have already got into the hands of bad guys, that listening is not detectable,
that listening is already illegal, that bad guys won't surrender their gear if
just another law is added. Only if they know the level of privacy they
currently have, will people ask for the level of privacy they want. Perhaps
it is now too late for enlightenment to have forced the only effective solution
o a real problem.

All my own opinions,

GM4ZNX

I have enjoyed using the R1. It has been handy to have a receiver with continous coverage. One use I put it to was tracking down a baby monitor that was interfering with some 49 Mhz VOX headsets. Its small size and light weight makes it ideal to take on evening walks around the neighborhood while monitoring the local public safety frequencies. It certainly has some shortcomings on selectivity (due to the wide FM mode) and the mentioned sensitivity in the AM broadcast band. Yet the small size is a big benefit for many applications. One interesting mode that was not mentioned in the review is that ability to scan between two set frequencies and automatically program the top

20 memories with the active chanels that the radio finds.

>Here's a question for orbital mechanists: why do we see space shuttles so
>rarely here in Germany, despite there being quite a number of high inclination
>missions? This time, the launch took place near midnight Euro-time, and that
>made it. Why does NASA usually launch in early morning (being afternoon here -
>no night passes)? Does this just coincide best with the working times of
>KSC's employees, is it essential for having the emergency runways in good
>light - or is there a much deeper meaning? When will we have the next
>mission like the one right now?

]NASA wants the short abort runway at the Cape, the Atlantic abort runway
]at Rota Spain, and the once around abort runway at Edwards AFB in California
]to all be in sunlight at launch time. That means a mid-morning EDT launch.
]As NASA's confidence rebuilds, these constraints are gradually being
]lifted again. Plus the current launch was to such a high inclination
]that the Rota site and the Edwards site would be unreachable if an
]abort occured during the ascent or the first orbit.
]
]Gary KE4ZV

Also the weather for a launch from Florida degrades during the day. Typical
day is clear in the morning with afternoon showers after the sun has had time
to heat things up a bit. The weather also wants to be bad whenever they try
to land here or are shipping an orbiter back. Usually they fly over the
office here on the way to the beach where they turn left and head up to the
Cape so we get pretty good viewing of the carrier and the orbiter.

Related to this thread, I remember seeing some "high-end" expensive audio patch cords being advertised and offered for sale in a stereo shop. "Monster Cable"? Anyway, they claimed that they had wide bandwidth. And that they used, in the center conductor, many fine wires for the high freqs, some thicker wires for the midrange, and one or two heavy wires for the bass. All insulated from each other like litz wire.

Gee, I wonder if this had wider bandwidth than the patch cords I made from 75 ohm teflon coax I had lots of. :-) I figure I had about 200Mhz of bandwidth. Think that's enough for audio signals. :-) :-)

I think the basic error here is that we are equating amateur radio
vhf-uhf transceivers to consumer FM broadcast band radios. When I
last checked my handhelds with an HP spectrum analyzer, there were no
`signals' ;-) in the aircraft bands. (even from the local oscillators).

|> one on each speaker lead, with 6-8 turns around each. I had to put
|> one on the power cord for my answering machine, in addition to the
|> phone line filters.

What also helps audio systems is to run sheilded speaker wire. I usually run what I call twin-ax. Two sheilded wires with another sheild around both.

Adding the Radio Shack/MFJ split-core ferrites at each end can really do the trick!

Read the following post posted back in June:

Steve Kuo, N8OPH, sdkuo@oakland.edu

===== starts here =====
From: skaggs@nsslsun.nssl.uoknor.edu (Gary Skaggs)
Newsgroups: rec.radio.amateur.misc
Subject: Question pools now available in ASCII format (almost)
Message-ID: <1991Jun17.230629.11362@uokmax.ecn.uoknor.edu>
Date: 17 Jun 91 23:06:29 GMT
Sender: usenet@uokmax.ecn.uoknor.edu (Nets)
Distribution: usa
Organization: National Severe Storms Laboratory
Lines: 30

Some of you have been following my journey of discovery regarding the
availability of the question pools in a format readable by all. As of
HAMCOM in Dallas this year, I have them all.

First caveat: The General, Advanced, and Extra class pools have addenda and
it is up to YOU to put the right info from the addenda in the right places.
Don't ask me to do it for you.

The other caveat: They are in UNIX compressed format. If you need assistance
with a non-UNIX system, contact me and I will e-mail you a copy. But if I
find that you had a UNIX system and were too lazy to ask your sysadmin how
to uncompress the files, your mailer will not survive! (No smiley).

(Smiley back on) I am tickled to death to tell you that Charley Kline has
graciously made available space for these files. They are in the same
directory as the Mac hyperstacks.

FTP them from: uxc.cso.uiuc.edu; anonymous login; directory pub/ham-radio.

Have a ball. Upgrade now and beat the rush. What better excuse for the
high-rent HF rig but to tell the spouse, "but dear, I NEED this radio for my
new privileges!" Just don't get caught.

This is posted for etxmalk@garbo.ericsson.se, who can't post directly:

Subject: HT's on an aircraft - I did it.

For the record, I have used my Kenwood 2400 on a commercial (scheduled) airline, Denver-Dallas route, back in 1982. I obtained permission from the pilot and crew and at a prearranged time (early into the landing descent) I made a short CQ on a simplex freq. and had a 3 minute QSO with a gentleman in Wichita Falls, Texas. Leaving the aircraft I asked the pilot if he had any problems from my transmissions and he said "no". However, some of the cabin attendents seemed a bit upset and moved me to a seat with no adjacent passengers for the test.

But the plane did not crash and I was not arrested and thrown in jail. In my opinion some previous warnings are stretching the facts.

Keywords: ICOM IC W2A, Crossband Repeat, PL (CTCSS), DC Jacks

What follows is a letter from ICOM in response to some of several questions I asked:
"....The DC jack you asked about can be purchased as an OPC-288 DC Power Cable <not in stock anywhere I called, and I forgot to ask the price>. As far as cross-band repeat and PL tones, it can't be done. The processor and the VCO's are at their limits and will not handle the extra task. ....

73'
(signature)
Christopher Wilken KG7OF
Icom Technical Support Representative"

Oh well, and he didn't answer my question about offset w/crossband, or the question about replacing those lousy hard plastic jack plugs, but I will take this opportunity to suggest a partial solution to the DC jack supply/cost problem:

Cut cord between wall charger that came w/radio and the DC jack. Attach any "standard" connectors to the cut ends so that they can be re-connected. It would be a very good idea to put the "standard" number of fuse holders on the DC jack side of the new connector (if you use two fuses and holders that separate, reverse one to avoid polarity mistakes-thank you KC6QFG for that point). Now you can make-up any kind of adaptors you want with a mate for the new connector on the DC jack cord on one end, and spade lugs/what-ever on the other.

Please post if this idea has any problems (I'll always post any flames sent me also, I believe they should be shared).

My $00.02...
(over 300 postings to rec.radio.amateur.misc in the 5 days I was out, way to go..I had a lot of reading to do when I got back!)

2884. Kenwood Service & TS-940 failure

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-19 00:15:10 UTC
From: CSMSCST@mvs.oac.ucla.edu
Message-ID: <19910918171213CSMSCST@mvs.oac.ucla.edu>
Source record: 293549

Can someone give me the phone nr for Kenwood Service? Are they still in Long Beach, CA? And can I take in a sick 940 myself, or do I have to send it via a dealership, as the manual implies. (This is a non-warantee repair).

Also, has anyone had experience with the following TS-940 failure? I noticed over the last couple of weeks that the dial lights were dimming whenever I keyed down. Upon disassembling the rig and measuring the various power supplies, I found the 21v supply is running 30.3v. The regulator isn't, and the circuit board in the vicinity of the pass transistor amplifier is charred - not a good sign. My question is, how much else is likely to have been fried by the 50% overvoltage -- if it were just the regulator, I'd fix it myself. I have the service manual, but it makes it abnormally difficult to figure out exactly what runs off the 21v supply. Things seem to be mostly working (I got the C9 long path yesterday AM with the 940 to an Isoloop, so things can't be too messed up!) but I am obviously hesitant to run it now that I know about the 21v = 30.3v problem!

2885. Re: Telephone RFI

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-19 02:46:32 UTC
From: rph@sq.sq.com
Message-ID: <1991Sep19.024632.10251@sq.sq.com>
Source record: 293553

I might add that reasonable RFI-proofing can sometimes be had without using any ferrite cores at *all*. I cured HF RFI in both my modem and terminal simply by curling the phone line and power cords going to them into grommets: Start by tying an ordinary overhand knot but keep on going 'round and 'round. If you take care to avoid introducing twisting tension in the cords, you'll eventually end up with a nice fat compact tight toroid of wire. Obviously, this is only feasible if you have several feet of line to spare in the first place.

It was a bit trickier for my PK232 TNC. For it I wound *all* lines going into it as many turns as I could manage around a picture tube yoke from an old TV. The effect was dramatic...

No, it's more than just adjusting a potentiometer. The method that is used is to motor turn on and off real quick (several 100 or 1000 times/sec). Say the circiut is on-offing the motor at 500 Hz, 50/50% on/off cycle, the motor would move at 1/2 speed. At 25/50% cycle, you would get 1/4 speed. This is the same method used in AC light dimmers.

The cross band repeat mod previously posted does indeed work on my IC-W2A

>Icom Technical Support Representative"

>Oh well, and he didn't answer my question about offset w/crossband, or the

If you have offsets programmed, you will get offsets while running
crossband repeat. Basically if you happen to put it in cross band repeat
mode, then what ever "side" that receives audio will retransmit to the
other "side" of the radio with the defined offset of that frequency. It
will ping pong back and forth too as the active "side" of the radio
changes just like it should.

It's a hot little box! Particularily when used in cross band repeat
mode (it really gets hot and it is constantly transmitting!).

I guess your hand-helds are an exhaustive assortment of all HTs in use. Pretty good, there, Rick. I think, however, you may have omitted my HT from your assortment; the Kenwood TR-2600A. The PLL uses a heterodyne down mixer in the VCO circuit to get the feedback frequency into the range the Motorola PLL chip can handle (10-20 Mhz). This heterodyne oscillator generates a signal at 144..148 - 10.7 - 10 Mhz, or about 122 Mhz, when receiving. I'm not certain what level the HT radiates at this frequency, but I do know it radiates enough energy through the lexan case at 10.7 MHz for me to use my FM equipped FT-747 as a monitor receiver ;-). If the level at 120 Mhz is even close, then it is loud.

Your signature indicates you are in Test Engineering... 1/2 :-)

Copy of message. From: K1GW To: ALL Date: 14-Sep-1991 1047Z

Want to know how to get a higher score in the CQ WW? Would you like to improve your station setup? Interested in meeting other hams involved in contesting and DXing? Come to Contest University, Wednesday, Sept 25 at 7:30 PM at the QTH of John Kenny, W1RR, in South Hampton, NH.

KC1F, Stu, will head the academic staff of many well known contesters. If you are coming please let John know so he can have the correct amount of pizza on hand. If you have academic questions please contact Stu. The subject matter will be tailored to the needs of the attendees. Everyone should get something from the evening.

This CU meeting is sponsored by the NH/VT Section of the Yankee Clipper Contest Club but you don't have to live in NH/VT or even by a YCCC member to attend. If you have a friend who might be interested please bring him/her

Msg #196 From: K1GW Date: 16-Sep 1714Z Subj: directions
Copy of message. From: W1RR To: K1GW Date: 16-Sep-1991 1714Z

From Interstate 95:
1. Get off I 95 at NH Exit 1
2. Take Rte. 107 West toward the Dog Track and Kingston, NH
3. Take a left at the blinking light. This Rte. 150
4. Go South on Rte. 150 for 0.8 mi.
5. Take a right onto Highland Rd.
6. After 0.7 mi. take a left onto Woodman Rd.
7. After 0.7 mi you will come to our house. The mailbox (#361) with our name on it is on the left and the house is on the right. It is a brown colonial with green trim, set back about 350 ft. from the road. There is some parking at the top of the driveway and more on the grass or small paved area just in off the road.

From Interstate 495:
1. Take I 495 MA exit for Rte. 150 North
2. Go through the center of Amesbury on Main St.
3. Continue on Rte. 150. It is Market St as you exit center of town. Keep right at fork in the road.
4. About 0.8 mi after crossing the state line, turn left onto Highland Rd. Follow steps 6 and 7 above.

From Rte. 107 coming from the west:
1. As you come through Kingston on Rte. 107 you can take a turn to the right (east) at a restaurant The ???? House. Where ???? is a year long ago.
2. After about a mile you come to Rte. 125 and Rte. 107 East is right

ahead of you. Get on 107 again until you come out to Rte. 150.
3. Follow steps 4 through 7 of the Interstate 95 directions.

>:Nav radio. In other words, tune the VOR to say 115.7 and the FM radio to
>:105 and the radio's IF oscillator WILL affect the nav and the CDI display.

I'd second to that. I have used my IC24ET many times as a test oscillator.
For example, when tuned to about 402 MHz it gives out around -60 dBm (one
nanowatt) on the 430 MHz band. When connected to a mobile antenna you can
hear the local oscillator up to 100 metres.

>:
>:Now as to interference from PC's - not proven to interfere, but cellular
>:has enough radiated power so I'd suspect receiver overload. Since cellular
>:is up at 800 Mhz it might not interfere with the UHF nav, but I wonder about
>:the DME and transponder at 1000 Mhz..

There is also another nasty side effect in using a cellular phone aboard.
The cellular companies dislike people who register to a dozen base stations
simultaneously. They might send you a bill for the hassle you have induced.
So switch off before entering the plane.

I am interested in the collection and restoration of OLD valve-type radio-sets.
Is there a local (OXFORD UK) and/or nationwide (UK) club/association/
organisation/magazine on this topic.
- Disclaimer: Please note that the above is a personal view and should not
be construed as an official comment from the JET project.

Not that I know of, in fact it's not that easy: For one thing you have to
do something about the gap in recording as the machine switches heads.
VCRs ensure that the sync pulse is there (and reconstruct it on playback).
Besides, converting 6 MHz of bandwidth from RF down to DC cleanly is non-
trivial.

Greetings:

Just bought a new a rcvr and am practicing the code so I can
upgrade to General from an old (1986) Tech ticket. Anyhow, while
listening to 40 mtrs this morning at 0530 EST I copied CO2MT 5x8
in several QSO's. I don't have a Handbook, so can't look up the
prefix. Can anybody tell me where CO2 is? And, are there any prefix
databases that are FTP-able so I can quit wasting bandwidth with
these silly questions?

Thanks,

This is a little off the subject, but I have some of those Radio Shack
RF remote control switches, and the hard wired types that I assume sends
info over the house wires via rf. The problem is that 1/2 of the house
is on one of the two legs of the 220 (or 240?) and the other 1/2 on the
other leg so there is no way for a device on one 1/2 of the circuit to
communicate with a device on the other 1/2. I have had to put two
separate rf receivers one on each circuit, in order to control switches
all over the house. I was wondering if using a cap such as above, but
accross the two hot circuits, would allow enough rf to pass for my
remotes to function properly? Also, I presume that if I tried the above
trick of caps from hot to ground, that it would effectively short out the
rf signals from my remotes so they wouldn't even work on the same side of
the 220. I guess eliminating rf interference doesn't come without cost.

2902. Antenna for 10m mobile

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-19 14:03:11 UTC
From: jkeller@pica.army.mil

What's the "best antenna for the buck" for 10m mobile? There must be lots
of opinions out there.....

I'd especially be interested in what Gary KE4ZV might offer...(BTW, Gary,
thanks for all your input/various subjects on the net.....yours are some
of the most articulate and useful)Oh, yeah....I don't want to drill any holes in my Honda,
and I looked at
a couple of mounts that grip the edge of the trunk-lid but the bracket
won't fit in that tiny well-engineered gap between trunk-lid and body.
Maybe all that leaves is mag-mounts?

If I AM stuck with a mag-mount, what's the best one?

And what say you all on base/shunt load vs whatever else?

Finally, seeing what Gary had to say about the Cushcraft 2m ringo the other
day (the "Cushcraft Dummy Load"), I hesitate to ask (but will anyway)...
what about that $50 baseloaded mag-mount whip Cushcraft offers.....friend
of mine says his works fine, but I'm skeptical.....

Jerry, K1MER.....<jkeller@PICA.mil> or just respond
on the net.....everybody loves
antenna stuff!!!!

Hi Steve,
B4 I can answer, I should ask what kind of roof attic you have?
If I can assume that you have wooden attic with shingles or shakes'
than you should not have any problem, otherwise any cement or ceramic
tile roof will be a problem. Also hope you don't have any air-condit.
pipes and/or heathing pipes around.
Your best guide is if there are non conductiv mtl. around you are safe.

All I can think of is that the 200 ma trickle charger has pretty small
wires that may not be up to the current you would need for
transmitting on high power. (assuming the same accessories that come
with the 24at).

I wouldn't expect the next shuttle mission to have these data available as
it will be a DOD (non-classified) mission, and even though it is non-classified
I would still be surprised if the orbital data is released prior to launch.

I just purchased on last Sunday. It is a HOT product. I would buy another
one in a flash. Functionality is on par with everything I've seen to date.
The manual is clear and well written (no Jinglish). I'll post a separate
list of functions/features.

PRESS RELEASE # 4 (19th Sept. 1991)

MESSAGE FROM TIRANA:

Things are moving along according to the schedule -- training and operating at ZA1A will continue untill October 7th 1991.

More operating hours will be obtained every day and a second station will be operational this weekend.

Currently the ZA1A station is located at the PTT headquarters and access is limited -- night-hour operating is impossible.

The opening ceremony was attended by 50 people. It was broadcast on Tirana TV. Among those present were high administrative officials from agencies including Albanian Defense.

The first contacts made by the Albanian students were IN3CKK (cw) and IT9HZC (ssb).

The Albanian student base is extremely qualified -- the 11 participants include 8 engineers representing several government and educational institutions.

On the evening of the 17th of September the atmosphere was warm and all ministeries were represented at the highest possible level.

This week will see many ceremonial activities. We are proud to be here and looking forward to working you all before leaving.

73

>to run it now that I know about the 21v = 30.3v problem!

I had the regulated power supply fail in my 940, too. The 30v
you're seeing is not good. I recommend you cease operation & fix
the problem. Actually, if the pass transistors go, there will be more like
40v on the 21v line. I had to replace the pass transistors and a bunch
of zener's in the final compartment, as well as, on the pwr supply
board. The cause of the failure I suspect is that one of the zener
over-voltage protectors in the Final stage shorted and presented a
dead short to the supply. The current-limiting/foldback circuit
didn't and the pass transistors blew. It took quite a while
to isolate the real problem to these mysterious zeners. I replace most
of the ones in the final and pwr supply boards. Couldn't get the exact
type (voltage value) so I seriesed some I got from Radio Snack (nee-Shack).
Good luck. If you feel you aren't inclined to spend the time to debug
the problem, send it to KWD or ask a good radio-expert (as in Grapes of Wrath)
for help. Kenwood may not even have the skill to fix it for a reasonable
amount. If the damage is extensive it could take them a while to fix it which
will cost you big bucks.
73 - Walt -K2WK.

I recently bought the TH77a gear. I was wondering if the
receiver can be modified to cover frequenciesfrom 500MHz to
900MHz. I know that the receiver can be modified for 117MHz
operation (bought the mod. book, the green book) but there
is no mention of anything on the higher frequencies.

I know that ICOM w2a has these capabilities even some without
any modifications (keyboard entry) and I was going to buy the ICOM
unit at first, but since I got special discout on the Kenwood, I got
TH77a.

Regards,
Pirooz
(still waiting for my call sign in the mail !!)

2911. Re: HT's on an aircraft

That's because you were looking for the signal in the *wrong* place. Take a look in the 10-11.7 Mhz range. Every case that I have seen of interference to aircraft nav aids has been the result of radiation at the IF frequency of the nav aid. It doesn't take much either, a -100 dbm carrier is sufficient. You're upsetting a sensitive phase detector, not jamming a voice link here.

According to my Webster's, "truism" means a self-evident truth; especially one whichis too obvious to mention. Since there is wide disagreement about the cited "truism", I'd say it ain't one. What passes for truth sometimes is nothing more than subjective opinion.

Congrats to Albania Hams!

2914. Re: ICOM IC W2A power cord

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-19 20:39:19 UTC
From: thayes@romulus.rutgers.edu
Message-ID: <Sep.19.16.39.19.1991.24425@romulus.rutgers.edu>
Source record: 293433

I have been using the method mentioned for 2 months now with no problems. I cut the charger cord and used RCA phono plugs (no flames about current handling ability please) to connect the Icom plug to either the wall charger or a 12 battery. I have also used it with a cigarette lighter plug in cars. I have experienced no problems and since there is only about 2 inches between Icom's plug and the RCA plug the wire's resistance does not come into play much. (I worried about it in the begining, but it never gets hot and there is no measurable V drop while transmitting.)

In article <1991Sep17.183558.28785@athena.mit.edu>
aviator@athena.mit.edu (Joakim Karlsson) writes:

>>I'm considering buying the Cushcraft AR-2 Ringo antenna. This
>is an older design compared to the ARX-2 Ringo Ranger and ARX-2B
>Ringo Ranger 2B. However, since I want to use it for both 2m
>and CAP frequencies (which are just above and below the 2m
>amateur band), I think I want the greater bandwidth provided by
>the AR-2.
>>My questions: Are there any other antennas I should consider
>>with similar characteristics (omnidirectional, 3.75 dB, small,
>< $40, SWR 2:1 10 MHz bandwidth). Or should I not worry about
the bandwidth so much?

Gary, KE4ZV, replied and recommended some other antennas, among
them the AEA isopole.

I'd like to underscore my agreement with Gary on this. About a
year ago our local repeater group needed a new antenna for our
two-meter rXYXWY. i0
9

,NH

,

%N0V0
,

=6
E
Ha
5
years, we've used a number of different antennas on the repeater,
most of them commercial designs. The only one of these that
worked at all well was a very old Stationmaster type 20 foot high
end-fed collinear which had good performance, but very high VSWR,
because it was designed for the Marine VHF band around 156-162
Mhz. The high VSWR drove our duplexer bonkers, so I embarked on
a search for a low-price replacement antenna. One of our local
club members, Dale, KS7G, recommended the AE9&opole`based`onMsome A/B comparison
s done in Oregon against the Ringo Ranger. To
shorten a long story, we installed the Isopole on our repeater
and were *amazed* at the good performance!! It had only a little
less gain than the old stationmaster, but also had a low VSWR
after trimming the radiator length to our transmit frequency. We

also worried about the Isopole's survivability on a 500 ft hilltop in Southeast Alaska. It made it through last winter just fine, but it was a rather mild winter compared to some we get.

The bottom line on vertical radiator antenna performance is the radiation pattern. It's only with the develepment of modern computer programs that we've been able to analyze antenna performance in a serious way. It turns out that the old style ground plane antennas have lousy patterns--their radiation goes mostly up in the air instead of toward the horizon. The reason? Insufficient decoupling between the radiator and the support mast/coax cable. Turns out that the feedline and mast have substantial currents flowing in them, and the whole shebang radiates like a longwire instead of like a dipole. You might think that this would help, but on VHF/UHF it doesn't. Longwires can have gain over a dipole, but it occurs in directions oblique to the wire rather than normal (perpendicular) to it. Building a real-world antenna with a good vertical pattern is not as easy as we all used to think--even if it's just a simple dipole.

The "secret" of the AEA Isopole lies in the funny looking cones and their placement on the mast. Their purpose is to decouple, or choke off the currents that try to flow down the mast. If you measure the length from the bottom of the radiator to the bottom of the first cone, you come up with about 5/8 of a wavelength. Turns out that the old ground plane antenna with the 1/4 wave spikes would have a much better pattern if the radials were about 5/8 long! This was all described in one of Bill Orr's columns in Ham Radio magazine about 5 or 6 years ago. Bill described the results of some research into vertical antennas and summarized the results.

The VSWR of an antenna is probably its least important parameter, but unfortunately, it's the easiest one to measure! That's why manufacturers pay so much attention to providing you with a low VSWR, because they know that customers are likely to measure it. To answer your question, the Isopole should have a usable VSWR bandwidth of about 3-4 Mhz, which should get you by for your MARS/CAP activities. Remember that most modern VHF transceivers and handi-talkies will easily tolerate a 2:1 VSWR for short transmit periods, and for receiving, VSWR is virtually immaterial.

I've wondered why AEA doesn't tout their fine product more than they do. Is it possible that most hams make their purchasing decisions based on packaging, advertising and appearance than actual performance! But then what else can we do, since antenna performance is so tough to measure. Another important factor that must also be taken into account is the size/weight of an antenna--what can you fit into your available space? Often compromises are necessary. After all, you don't need the last

word in performance to reliably hit the local repeater!

Good luck and 73,
Herb Holeman, WL7BIL

2916. Reflections from MIR?

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-19 21:09:24 UTC
From: john@anasaz.uucp
Message-ID: <1991Sep19.210924.9440@anasaz>
Source record: 293454

I have noticed that when MIR goes by heading east from here, I occasionally hear fluttery signals from other stations calling him. I wonder if there is a possibility that these are reflected, or if it is some other mode of propagation (today, for example, there was a cold front between me and 5-land where I heard another station).

If I assume a radar cross section at 2 meters of 100 meters for the MIR, a station 200 slant km from MIR, with MIR 200 slant km from me gives a huge path loss. If the station runs 1KW into a 14dB antenna and I have a 3dB antenna, I only get -142 dBm. The thermal noise floor at room temperature for 2M NBFM is about -124 dBm (your mileage may vary depending on filters).

Has anyone else noticed this effect?

PS - anyone digipeating through mir to CQ is likely to get an answer from me if in range. As far as I can tell, channel congestion makes it almost impossible to get long packets through.

Yep. There is some corrosion. I had the ARX-2B for a year and its got some cruf on it. A real problem with the ARX-2B, in my opinion, is the radials. They are stainless, I think, but screw into an aluminum collar that is placed around the mast (which you supply). Getting this collar level and tight is a real chore. I ended up nearly stripping one of the threads in the collar while reinstalling it on an aluminum mast. Also, if you strip it during initial assembly or later, then cushcraft won't replace it as under warranty.

2918. RC help/experience sought

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-19 22:19:25 UTC
From: slp9m@cc.usu.edu
Message-ID: <1991Sep19.161925.49272@cc.usu.edu>
Source record: 293569
Cross-posted to: rec.radio.amateur.misc,rec.models.rc

A friend who I introduced to ham radio is an RC enthusiast. He has asked me some questions about RC that I am not prepared to adequately answer.

My friend's resources are limited (High school student with paper route). He would like to move his RC operations from 72 MHz to 6m, but can't shell out for an all new setup. Hence question #1. What's involved in moving 72 MHz gear to 52 MHz? Obviously, change xtal, lengthen antenna, retweek. But that's roughly a -28% change in frequency. Will the stuff that has to be tweeked in the RC tx/rx pull that far? Does anyone have experience with such an attempt to share?

Question #2. How feasable is it to increase the number of available channels on existing equipment? My understanding is that in RC lingo "channels" refers to multiplexing in the time domain, but I must confess ignorance as to the details of implementation. Does anyone know how easy or difficult this is to hack?

BTW, The equipment is manufactured by Airtronics. I've taken down the model numbers but do not have them at hand.

Any help would be appreciated. Mail it or, if you think it appropriate, post it. Thanks in advance & 73, Scott

The half life of radium is 1590 YEARS. Any that was in the dial is still
going strong! The radiation has the effect of burning the zinc sulfide
luminescent material. That is why it stops glowing.

2923. Icom IC-U16

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-20 01:12:12 UTC
From: rosty@ucscb.UCSC.EDU
Message-ID: <21095@darkstar.ucsc.edu>
Source record: 293440

I recently picked up an Icom IC-U16 radio used, and am having a problem with it. Everything seems to work great with it, with the exception of DTMF. It just flat refuses to send DTMF tones. All other functions are intact. I don't have a service manual (yet...ordered it from Icom today), and I'm wondering if anyone has any ideas or suggestions. The users and programmers manuals mention nothing about deactivating DTMF, which is what seems like happened.

Post to the net or reply via email. Thanks!

From: winter@Apple.COM
Message-ID: <57569@apple.Apple.COM>
Source record: 293441

The 1991 California QSO Party will be hitting the airwaves soon.
Get the dust off those antennas and tune up those amps! (Those of
you in areas where it's rained in the past six months can ignore
step #1. :-))

The contest begins at 1600Z on Saturday, October 5 and goes till
2200Z on Sunday, October 6. Single ops are limited to 24 hours.
Full details should be in the September ham mags. Logs are available
from Jim, WA6AUE, at his Callbook address in lovely Truckee. There
are separate awards for in-state and out-of-state stations.

Those of you in California (or nearby) who are looking for an
adventure might want to contact Bob, N6TV, to find out which counties
he still needs put on the air.

73,
Patty

p.s. I should be on from San Diego for at least part of the contest.
But you other San Diegans should still have a chance because I'm not
moving my awning antenna down to SD with me. (It won't fit in the
back of the Porsche--and besides, my bougainvillea plant in Sunnyvale
still needs it for shade.)

2925. Re: 2m Antenna

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-20 03:05:00 UTC
From: jweiss@casbah.acns.nwu.edu
Message-ID: <1991Sep20.030500.8846@casbah.acns.nwu.edu>
Source record: 293442

I don't know about some of the other antennas, but when I was looking around for simple two meter vertical, one of the attractive things was that the vertical was grounded. As I put this on the top of tower, that was an important consideration for me. (Yes, I have additional lightning arrestors on the coax, tower itself is carefully grounded, trust bearing bypassed, etc...). In an earlier life, the shack took a hit and I'm even more paranoid these days.

Because I live in the Chicago area, there is a thin line between having an antenna good enough to reach all the local repeaters with a few watts and keying up the entire midwest. This antenna seems to fit that niche for me. I wouldn't recommend it for someone looking for (DX) performance.

If you have operate on multiple bands, look at the discone antennas. The SWR is usually tolerable over 1 decade (50 -1000 Mhz or so) and they have gain roughly equal to a 1/2 wave vertical.

2926. Standard Radio C228a HT

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-20 04:38:47 UTC
From: jweiss@casbah.acns.nwu.edu
Message-ID: <1991Sep20.043847.12408@casbah.acns.nwu.edu>
Source record: 293446

I recently saw a question or two about the Standard C228a, a
144/220 Mhz dual band HT. I have not purchased mine (yet!), I plan
to do so shortly. By all appearance and reviews, it is a very good
unit. Below are some summaries from the comments and feedback I recieved
from fellow net users. I'd like to thank all those who replied to
my inquiry. I'm going to talk the vendors rep's at a hamfest this weekend
and if I find anything out I will post it.

Jerry WB9MRI

From banko@lisboa.ks.uiuc.edu Tue Jul 30 18:01:14 1991
standard has a long and respected tradition in radio equipment... i don't
know what exactly they have done, but they have been around for many years
and that says a lot already.

ps: in a recent QST HT review article, the standard c228 was a favorite
among the reviewers. i can dig up that reference also...

<<< The article is June 91 QST page 36-41. >>>

From ewb@swlvx2.msd.ray.com Fri Jul 26 14:20:41 1991
Don't have any reservations about buying the Standard dual
bander. It is a great radio. Standard is larger than Yaesu, Icom,
and Kenwood COMBINED. Their radios are of the HIGHEST quality and
have features not found on any other amateur rigs such as PL scan.
The dual band antenna that they supply even works well.

From tim@ais.org Thu Jul 25 00:48:39 1991

Since then, about 10 people I know & often talk to on the local 220MHz
repeaters have bought the C-228A, & all are very pleased with it. One
friend of mine --who I encouraged to get his ham license-- depended on me
to pretty much tell him what radio to buy. The guy is only 17 years old, &
I knew that a decent HT for him would be a very major investment, so I did
a lot of research before I finally recommended the Standard C-228A.

The C-228A is very high quality, & has some great features, too (like auto
PL find!).

From: "James J. Conrad" <72401.2767@CompuServe.COM>

I have the C228A you spoke of and I'm really pleased with it's performance. It was the first new gear I have ever purchased. It has so many bells & whisles that I won't go into to much detail here. My last HT (and it was my first and only) was an Icom IC-02AT. Well the 228 is every bit as good. The unit has more memory's and it was a wider receive coverage than the 02. It doesn't have as wide a receive as some of the other newer units such as the Alinco's though. Receive is 130-175 Mhz and 200-240 Mhz (the expanded rec on 220 is useless because the stuff their is AM and the 228 is not capable of receiving AM). The mike/speaker handset you used with your Icom HT's is compatible (functional and plug). The unit has full cross-band duplex and DTMF paging. I can go into more detailed if your interested.

From Keith.Thompson@EBay.Sun.COM Wed Jul 24 10:20:49 1991

I recently purchased the Standard C228a from HRO in Burlingame CA.
I had to think about it for quite some time before I took the plunge.
After reviewing the Owners manual in the store I found that at first glance the radio had most if not all the features of comparable 2m/440 HT's from other vendors. The one thing that hurt was the price tag.
It was $600 with out the PL unit, the PL unit was another $60 bucks.
I got both the radio and the PL since most if not all 220 repeators in the SF bay area are running PL. <<<<< I think PL is standard now>>>>

Well to make a long story short I was impressed with the quality and function of this radio. When I held it in my hand for the first time it felt solid. It is reasonably compact for a dual band radio. It has nearly all the features that are most talked about(if you would like I will sumarize the features from the owners manual, just let me know by email).

As for accessories like batteries and mikes etc.. HRO did not have these items in stock when I bought the radio but would order them for me. I did not have them order anything extra since my budget had been depleated by the purchase of the HT allready. I have had the radio for about 2 monthes now and have no real complaints. There are other dealers that advertise this radio besides HRO but I can't recall which ones, they advertise in QST.

The method mentioned above seems to be the only way out of buying the overprized power cord. Is it really so that nobody has ever seen the matching plug anywhere? It can't be manufactured just for Icom.

For those readers that have never seen a W2 or the SR series, the plug is a coaxial type connector about the same size as the conventional DC plug. Apparently Icom has chosen it since the miniature plug in S series and the 24 is very unreliable. The new one is absolutely superior to it, only could I find those separately...

Message-ID: <16610063@hpqmolm.sqf.hp.com>
Source record: 293339

Gary's done a nice job of covering the fact that loudspeakers have wildly varying impedance over the audible spectrum, have resonances and need damping.

Someone earlier said that driving an *ohm speaker from an 8ohm source would be ideal. IT WOULD NOT. As Gary C pointed out, the speaker Z is a very complex function of frequency, true atching would require the amplifier to present the complex conjugate of the impedance function of the speaker being used. (just wait til the pundits try that :-).
Loudspeakers actually require the lowest possible drive impedance :

Sound pressure is roughly proportional to cone velocity
Speaker resembles an electric motor, and so makes a "back EMF" that is proportional to cone velocity, and opposes the electrical drive.

In this way, if the loop resistance is trivial, the speaker takes whatever current is needed to accelerate the cone until the cone velocity tracks the drive voltage, hence the drive voltage sets the sound pressure being made. This gives us a flatter response, the effect of the changing speaker Z just affects the current being demanded from the amplifier.

Matching is generally a bad thing whenever you want to shift POWER, as 50% of the power generated will get to the load, 50% gets dissipated in the source impedance. Just 'cos it says 50 Ohm by the output of your transmitter does not mean that it looks like a 50 Ohm source, it means "Please connect me to a 50 Ohm load "
Matching a source to a transmission line is not important if you only intend to have a uni-directional signal flow. if the antenna matches the line and so takes all the power reaching it, none is reflected, so no power returns to the transmitter, and it doesnt matter what fraction of none gets reflected !

2930. Audio snake-oil salesmen!

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-20 11:33:58 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <20.Sep.91.12
Source record: 293471

Some other giggles from the World of Audio:

1) Remove all the fuses from the AC circuit feeding the audio equipment;
the fuses introduce undesirable impedances that reduce transient response.

2) Use gold-plated connectors in the power feeds. The reduced electromagnetic
potential of gold compared with brass helps to reduce waveform distortion
of the AC line voltage(!) and improves audio quality.

3) Use a green marker-pen to color in the 'edge' of compact disks; the green
color absorbs refracted light from the (red) laser and reduces background
noise & distortion...

4) Polish the surface of compact disks with Armor-all(tm) or similar
product so as to reduce diffusion of the laser-beam penetrating a dull
surface.

I guess if you are a committed worshipper at the Shrine of Sound, then you may
be seduced by these temptations. Me? I still use the class 'A' push-pull
amplifier (four 807's) i built in 1967....

2932. Perseids

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-20 12:51:51 UTC
From: MROWEN%STLAWU.BITNET@cunyvm.cuny.edu
Message-ID: <9109201300.AA16187@ucsd.edu>
Source record: 293472

I have heard several reports from Japan and Europe that
this past August's Perseids metoer shower was much stronger
than usual. It appears that there was an "outburst" that
largely missed North America. Speculation among astronomers
is that the parent comet of the Perseids, previously presumed
lost, is about to return. If so, then the next few years of
Perseids could be quite exciting.

I would appreciate any reports and observations of this year's
Perseids, especially from Europe and Asia. Both visual and
meteor-scatter observations are welcome. Please be as complete
and date/time-precise as possible; the goal is to closely nail down
the ecliptic longitude of the most dense part of the stream so that
return peaks can be predicted accurately.

Thanks in advance -

Don't home VTRs break down the video signal into components before recording?

seems like i recall that the relative positions of the carriers get switched around also (plus adding in the Hi-Fi subcarriers for both audio channels).

VTRs just aren't 5 MHz wide recorders. there's some other manipulations going on to make it possible to get 6 hours of TV signal on a very small quantity of tape.

OTOH, would a D1 digital VTR do the trick (was told that D1 just records everything making it signal format independant but i don't know for sure)?

Likewise, I have had absolutely NO success in locating accesories for my
ICOM IC-W2A *sigh* And to think, I'm absolutely dying to by a 2SRA as well...

What I did is similar, but I think 'better'

I cut the plug from the supplied wall charger and connected the Radio Shack
locking connector to it. Then I bought a cigarette lighter connector, and
cut the end off it. I then put the matching interlocking connector onto that.
I've also put a set of connectors off my 13.8V power supply at the QTH, and
in general have standardized around this connector, as has our local club.

>-Dennis Spexet (N0OKR), spexet@ux.acs.umn.edu

My wife (KI5EV) has owned two different Heath H/Ts built by Standard. She was happy with the first, one of the dual band units that she sold because she wanted something smaller to carry in her purse. She's even happier with the 2 mtr Micro H/T she got at closeout price from Heath. We knew Heath was going out of the s/w business, so we call Standard NA and asked about support, parts, battery packs, etc. The were very friendly and responsive and supportive. Later, at HAMCOM Dallas we talked with the Standard reps at their booth, and they were equally open. Also tried out the model your interested in - obviously no long term review, but it looked nice, was easy to work and didn't seem bothered by all the pokes and prodding it was getting from curious folk.

Interestingly, the new Alinco DJ-F1 looks very much like the Standard/Heath Micro H/T my wife bought. By the specs it has improved capabilities and more memories. It uses the same type battery pack. (Interesting primarily because Standard has stopped making the radio we bought, but here's Alinco producing the same form factor radio with better electronics with a better suggested list price.)

Cheers & 73

>be tweeked in the RC tx/rx pull that far? Does anyone have experience with
>such an attempt to share?

Coils and caps would need to be changed also.Usallaly they just swap thr RF
board in the TX and the RX.There are two ham r/c bands,the old 53Mhz and the
new channel numbered 50Mhz whic also must meet '1991' specs.Usallay requires
FCC lincense to do work on RF section.D&J electronics can do this type of work.

>Question #2. How feasable is it to increase the number of available channels
>on existing equipment? My understanding is that in RC lingo "channels"
>refers to multiplexing in the time domain, but I must confess ignorance as
>to the details of implementation. Does anyone know how easy or difficult
>this is to hack?

Depends,most all non-computer radios use the Signetics 5044/5045 chip set
which is good for up to 7 channels.(functions).A lot of the pc boards
already have the holes for the extra componets for the extra channels,
the manufacter just stuffs whats needed for how many channels is desired.
ACE is a good source of AUX pots for extra channels.You will need to figure
out some resistor values.

>BTW, The equipment is manufactured by Airtronics. I've taken down the model
>numbers but do not have them at hand.

I have converted an Airtronics XL 4 channel to 6 and a JR MAX 4 to 5.

Nope, no signals there either. Are you telling me the IF sections of NAV equipment are unshielded??? Like consumer TV sets? ;-) If thats true then I'll never step on board another aircraft! Guess it's time to stop all this guessing and contact a few manufacturers of VOR's etc. and see what they have to say on the matter.

--

Jerry,

I have been using a Wilson 1000 mag-mount on my Accord for about a year now. I am extremely happy with the performance of this antenna. I run a Uniden 2600 with 25 watts out. The thing has never budged; even at 85 MPH + (I was on a race-track :^)) The swr is below 1.8:1 across 28.300 - 29.700 MHz. The cost was around $70.

Sunday, I even managed a ZS station while cruising down the Mass Pike.

>What's the "best antenna for the buck" for 10m mobile? There must be lots
>of opinions out there.....

Best for the buck is a bumper mounted full length CB whip cut down 10%,
about 99 inches. They're cheap, they're full size, and you don't have to
drill any holes if you use a strap or chain mount.

>I'd especially be interested in what Gary KE4ZV might offer...(BTW, Gary,
>thanks for all your input/various subjects on the net.....yours are some
>of the most articulate and useful)

<BLUSH> :-)

>Oh, yeah....I don't want to drill any holes in my Honda, and I looked at
>a couple of mounts that grip the edge of the trunk-lid but the bracket
>won't fit in that tiny well-engineered gap between trunk-lid and body.
>Maybe all that leaves is mag-mounts?

The bumper mount will perform better than a short mag-mount and truthfully,
the mag-mount will likely work better than a trunk lip mount. Most trunklip
mounts achieve a terrible RF ground connection to the body with their
skinny little brackets. The capacitive coupling of a well engineered
mag-mount actually gives you a better RF ground. No DC ground though,
static buildup can be a problem.

>If I AM stuck with a mag-mount, what's the best one?

The K40 is good considering that it's base loaded.

>And what say you all on base/shunt load vs whatever else?

It's generally better on a shortened antenna to get the coil up higher
where the current is less so losses are reduced. Something like the
Carolina Bugcatcher design with a large diameter air core coil at the
center of the antenna is more efficient. A capacity top hat helps too.
But now we are talking ugly with a capital UG. If the full length whip
is too much, then a center loaded design like the Hustler is a good
compromise between performance and looks. If you must use a base loaded
design, then the quality of the coil becomes critical since it will be
at the highest RF current point on the antenna. The K40 has a well
engineered base loading coil that is quite a bit bigger than the average
base loading coil.

>Finally, seeing what Gary had to say about the Cushcraft 2m ringo the other
>day (the "Cushcraft Dummy Load"), I hesitate to ask (but will anyway)...

>what about that $50 baseloaded mag-mount whip Cushcraft offers.....friend
>of mine says his works fine, but I'm skeptical.....

Cushcraft makes lots of fine antennas. It's just the Ringo that sucks rocks. Actually, even the Ringo isn't that bad if you take some precautions and understand it's limitations. The Ringo suffers from early corrosion failure due to the materials and method of construction. It also has a poor omni pattern due to the feed method and lack of a proper groundplane. You can take corrective actions that nearly solve both problems. The question is, though, "Why bother when there are good antennas available for a few dollars more?"

One final thought for the day. All too many amateurs compromise their antenna systems. When you spend $1,000 or more for a radio, it doesn't make sense to save a few pennies on the antenna system and feedline.

Gary KE4ZV

2941. Can you rejuvenate old radium dials?

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-20 14:50:25 UTC
From: rats@ihlpm.UUCP
Message-ID: <9109201450.AA13659@ucbvax.Berkeley.EDU>
Source record: 293455

If the half-life of radium is 1590 years, and the Zinc Sulfide phosphor is the part that wears out, is it feasible to rejuvenate to the part by painting the old phosphor with a thin coat of Zinc Sulfide?

Speaking of tritium, I once read an article which said that a German smallarms manufacturer (Heckler & Koch) had an optional sight of sights for their PSP (P7) handgun that utilised a plastic in which the hydrogen atoms were replaced with tritium. The plastic contained a phosphor, and so glowed continuously to function as aiming points for the weapon.

Has this technology been used for any product on the commercial market? It would seem to be perfect for use on receiver dial pointers and the like. Certainly, ALL the Walkman type FM stereos with analog tuning would benefit. I don't think it would be that expensive. Has the NRC licensed this technology for use in the U.S.?

I have been using HamComm for a couple on months now and have made
about 500 RTTY QSOs in the mean time. This program really works
well!

How to transmit? Connect your computer's speaker terminals to
the AF input of your transceiver through a coupling capacitor
(100nF). If you read on in the on-line help manual, you will
find the description. DL5YEC suggests a low pass filter to be
used to prevent harmonics from being transmitted (AF harmonics,
that is). The transmitted signals is not as "clean" as a
that of a filter converter, but I have heard no complaints so
far.

For those who don't know about HamComm: This is a RTTY program which
does most of the decoding on the software side. All you need for
reception is a signal limiter in front of the RS 232. This
consists of a LM741 and a few resistors. The program has several
nice features like a tuning indicator, spectrum display, very
flexible text memories, etc etc.

Have a look! I got it from wustl.wuarchive.edu, directory
mirrors/msdos/hamradio:

-rw-r--r-- 1 root archive 110935 Mar 8 1991 hc910308.zip

This is an older but still very good version of the program.
The newest release is of September and includes a couple of
minor additions and enhancements. I have not found any bugs
in the original version, though.

Aaack. I can only handle so many blasts from the past in one week.
First W2FNT, now this. I was at Steven's from '74 to '78. Yup, that
was an R-390, or possibly an R-390A, acquired surplus from MARS (thanks
to a certain illustrious alumnus). When I saw it, it had serious alignment
problems (i.e. somone had messed with the cams. It didn't work at all on
some bands.) The manual had disappeared. Now I notice that W2BSC is
no longer in the callbook, and the old alma-mater has turned into a
slick money raising/investment organization. I'll bet the sophmores don't
even hose down the freshmen with the firehoses in the dorms anymore.

Sigh. I'd be afraid to go back.

2945. PVC Tower

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-20 17:18:00 UTC
From: jennings@abb.COM
Message-ID: <9109201630.AA22133@nms1.abb.com>
Source record: 293476

Hello,

I'm considering building a free standing tower for supporting the end of a dipole antenna. I while back (a few years I think) I heard of someone making a tower out of pvc pipe or tubing! This was supposed to be an econominal approach. So I was wondering if anyone has heard of it and / or has experience building one or could give me references?? Please send replies to: jennings@abb.com.

Thanks in advance

Tom Jennings, KV2X

2946. Help with Memory Keyer Recommendation

2947. Jamboree On The Air

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-20 18:13:50 UTC
From: paulz@hpspdla.spd.HP.COM
Message-ID: <32920030@hpspdla.spd.HP.COM>
Source record: 293333

The Jamboree On The Air or JOTA will be the weekend of 19-20 October. In this annual event, Boy Scouts and Girl Scouts around the world use Amateur Radio to communicate with each other.

This is a wonderful opportunity to introduce young people to Amateur Radio. Instead of trying to impress them with a QSO full of our usual techno-speak, during JOTA the Scouts will quickly make friends on the radio talking about things like camping and the World Series.

You can participate in JOTA at any level of effort you choose. Invite the boy next door to your shack for the afternoon. Use a club station and invite the entire troop. I will be at a camporee that weekend operating "Field Day" style with 200-300 scouts in attendence. Although much of the JOTA activity is on HF SSB, you can also use CW, packet, or whatever. I know of one boy who got his license after seeing fast scan TV.

You can make contact with scout troops in your area by looking in the local phone book. Notices in the local community newspapers will also get attention. Don't forget the Girl Scouts. We need more YL operators.

The best part is that this is not a contest. You don't need to chase multipliers, worry about duplicate QSO's, or fill out complicated forms.

Details are in September QST, page 62.

2948. X-windows Hamradio programs wanted

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-20 19:10:52 UTC

Message-ID: <1991Sep20.200809.20196@borland.com>
Source record: 293465

>FTP them from: uxc.cso.uiuc.edu; anonymous login; directory pub/ham-radio.

Those files are out of date. The are from before the changes to the pool that were instituted last year, and of course, before the no-code Tech license.

I'll ftp an updated set of questions if someone will tell me the proper procedure (a writeable directory on uxc.cso.uiuc.edu or other suitable ftp site and the email address of the person to notify to get the files put in the right place). I will *not* load down our relatively slow connection to the net by trying to e-mail the files to people. If you have the information on ftp'ing, please reply to me by e-mail.

73,

2953. Re: HT's on an aircraft

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-20 20:13:44 UTC
From: eshamilton@lbl.gov
Message-ID: <1991Sep20.201344.22751@csam.lbl.gov>
Source record: 293464

Here's the test for those who think that HT's can cause no problems to an
aircraft's nav equipment:
They sit ALONE in a pilot's seat flying through mountainous terrain in
thick clouds with some moderate chop. They are on instruments on
approach to an airport with lots of other aircraft in the vicinity.
When they are pouring with sweat, ATC is yelling at them to
correct their heading because that are drifting off the localizer
and droping below the glide slope. Then we have a timer that keys
an HT that's somewhere on the plane.
If the disbelievers are willing to submit to this test, then they can
use their HT's on an airplane--but not one I'm on please.

2957. Receivers: slightly smarter stupid question.

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-20 22:49:22 UTC
From: rja@batcomfs.Eng.Sun.COM
Message-ID: <20320@exodus.Eng.Sun.COM>
Source record: 293330

It's me again.

When last we left our intrepid hero, he was studying for his
Technician exam, his entrance into the world of amateur radio.
He posted a request for recommendations of a good wideband,
all mode, receiver to complement his R1 portable scanner.

Unfortunately, not knowing all the jargon, he misphrased his
requirements. So here they are, hopefully better founded:

Objective: good reciever covering as wide a band as possible,
similar to R1, but biased towards the upper end of the spectrum
if need be. I'm not super interested in HF right now. Something
like the R7000 is what I'm looking for, but it seems to lack
a few things.

Price: a max. of approx. 1 grand.

Features: ability to scan and monitor upto about 2000 MHz. A good
selection of filters. Self-contained (not super important, but nice).

Questions: I've looked at the spec sheets for the R1 and compared it
with the R7000, and it seems as if the latter has very few useful,
additional, features. It doesn't have a notch filter for instance.
I would think a notch, and other, filters would be expected on a rig
running over 1K dollars. Am I wrong?

Also, what is a "good" level of selectivity? The adburbs for the
R1 talk about a given value of uV at a given freq and dB level, but
for the 7000 the specs use a "more than X at -6dB and less than Y
at -40dB". My previous exposure to personal high tech having been
home stereo, I'm not unaccustomed to advertisers trying to paint their
specs in the greatest possible light. Also, in the case of freqs,
I've seen tapedecks talk about freq range in a given dB range. But
I'm not quite sure how to map it to receivers.

I'm hunting out bits of information from the ARRL Now You're Talking
book, but some FAQ type information would be most appreciated.

Thanks in advance.

2958. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-20 23:23:32 UTC
From: tkelso@galaxy.afit.af.mil
Message-ID: <tkelso.685409012@galaxy.afit.af.mil>
Source record: 293248

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space and rec.radio.amateur.misc. This week's elements are provided below.

2959. Icom IC-24 display mask?

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-20 23:39:09 UTC
From: luru@stekt.oulu.fi
Message-ID: <LURU.91Sep21013909@stekt.oulu.fi>
Source record: 293473

Is the loose plastic mask covering the IC-24 frequency display
available as spare part? My local dealer says no, but I just can't
believe it.

I'd hate to buy the whole front cover for the radio just because the
display is scratched.

Part number appreciated.

Luru

2960. Re: Audio snake-oil salesmen!

Never heard this one before. Can you insure someone else property with yourself as the benificiary(sp?)
>
>2) Use gold-plated connectors in the power feeds. The reduced electromagnetic
> potential of gold compared with brass helps to reduce waveform distortion
> of the AC line voltage(!) and improves audio quality.

I used 'em because I lived in a "salt" state. Only in the car though where AC is scarce (actually not scarce, but confined). Now I only use them on signal connections were the equipment has them as well. (diode and corrosion prevention mainly. It really does make a measurable difference on the signal lines (as opposed to speaker level lines)
>
>3) Use a green marker-pen to color in the 'edge' of compact disks; the green

> noise & distortion...

I laughed so hard when I read this ....

>
>4) Polish the surface of compact disks with Armor-all(tm) or similar
> product so as to reduce diffusion of the laser-beam penetrating a dull
> surface.
This one works. It prevents/fills in scratches and removes dust. Error correction is good on CDs but can't recover what it can't read at least a majority of. I used it to recover a CD I bought as used that had a large gouge in it. I use a high quality paste wax, although there are specialty products to rip you off as well.

It seems that most rec.audio.voodoo is based in facts that are blown out of proportion. Big speaker wires are a definite win (assuming you keep them as short as you can as well. Over big is a win for the seller :-).

Gold connectors are a win in hostile environments IF you can't otherwise make waterproof/gas tight connections. I solder my power connections and use "gooey" heatshrink if possible. Gold connectors also only work well mated to other gold connectors (Can gold be one side of a metalic junction diode?).
I also use shielded cables on all pre-amp side signal cables with proper

instrumentation pratice of only grounding one end of the shield.
As a side note: I used to have a instrumentation manual that claimed
double shielded (differential) cables were a big win in noisy environments
and that proper practice was to ground one shield at one end, and the other
shield at the other end. (the shields are insulated from each other of
course) Which end (instrument, or experiment) gets the outer shield ground
or does it matter? How much does a double shielded cable buy you over
a single shield. Personally I looked at this and thought that it was just
a ground loop with a cap in it, but I push bits for a living, rather than
make heart monitors.

Anyone know a source of supply for 50 to 100 amp small fuse blocks suitable
for automotive use? Can take cartridge or other common fuses. I have to
wire my 'stang soon, and want a "near the battery" fuse block/power
distribution point.

/Tjp
(of course I also jumper frame setions and body panels on cars with heavy braid
and seal it with silicone seal. I LIKE good grounds.)

2961. Federal Frequencies

If anyone out there has ANY active Federal Frequencies for the
Cleveland, Ohio area, please send them to me.

I am looking for some interesting frequencies to monitor.

Also, if anyone has any frequencies for Major cities, please send
them to me also. I will post them on my SIG.

Thanks,
Scott Berringer

2962. Looking for suggestions on free/shareware KNWD XTRL

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-21 01:35:26 UTC
From: omh@cs.brown.edu
Message-ID: <86835@brunix.UUCP>
Source record: 293469

In my spare time (Hah!), I'm rolling my own Kenwood computer
control program for my TS-440S.

It will run on a Macintosh under HyperCard (please no Macintosh
or HyperCard flames -- I want to actually get this done someday
and don't want to make it a major opus.)

Right now it polls the radio every second or so and gets the current
settings and throws them into some text fields. I already have
plans to install a scrolling list field where every line represents
a memory (line 1 = memory 1) so you can type in a line of descriptive
text about each memory. Double clicking on the line will tune the
radio to that memory.

Now, before my design is set in concrete bits, I'd like to garner the
suggestions from the esteemed net ham community in what they'd like
to see in such a beast, specifically logging and contesting ability,
which I have had no experience, so you'll have to give a pretty detailed
description.

When I'm done, I expect to release it as either a freeware or a shareware,
the shareware only costing enough to cover any support costs I may incur.
(It'll probably be freeware, but if it's feature ridden enough that
people are going to be calling me with questions for its use, than I
might go to a shareware of $5 or so.) The choice of HyperCard will make
it easy to modify, especially for those who don't want to dive into the
toolbox.

So let me know what you'd like to see.

* HAM RADIO HEADS BACK TO SPACE *
================================
NASA astronauts Brian Duffy and David Leestma have recently passed
the Tech Class amateur radio operator license examinations plus
plus 5 WPM code at a W5YI-VEC testing session held in Houston.

Duffy is currently assigned to be pilot on STS-45, Atlantis,
which is scheduled for launch in May 1992. Leestma is
assigned as a Mission Specialist on the same flight. Both
are currently awaiting their amateur call letter assignment.
SAREX (Shuttle Amateur Radio Experiment) is requesting FCC
waivers so they can operate from space.

Atlantis will carry a total crew of 7 on an 8 day mission.
Because of space and power limitations, they will be
restricted to battery powered FM voice operation on two
meters. But they will fly a high inclination orbit, much
like those flown by Owen Garriott/W5LFL and Tony
England/W0ORE (57 degrees) so they will pass over most of
the populated areas of the world. This will include good
coverage of the United States.

As planned, this will be a CQ mission, meaning there will be
several attempts to work as many hams as possible. There
will also be some school contacts arranged. Working details
will not be available until approximately 60 days before the
launch. SAREX plans to release the time table and frequencies
as soon as they are available, probably around March 1992.

The mission's prime objective will be to use an Atmospheric Lab for Applications and Science, that will be carried in an igloo in the payload bay.

[Info from Roy Neal, K6DUE, former NBC newsman, and SAREX NASA liasion, via W5YI]

* BACAR FLIGHT NEWS *
==========
SA AMSAT is planning to launch a special BACAR (Balloon Carrying Amateur Radio) mission on Saturday 19 October to provide Scouts and Girl Guides with an interesting project in addition to their JOTA activity on the HF bands.

The mission will be launched at 06:00 UTC and should last several hours. The payload will consist of a recovery beacon, a telemetry system and a store and forward audio repeater.

The recovery beacon will operate on 145.550 MHz and will be on while BACAR is below 20,000 feet. This beacon is primarily for use by the recovery team who use this signal for their DF doppler systems.

The telemetry systems shares the same downlink as the audio store and forward repeater on 145.800 MHz transmitting FM, AFSK RTTY at 50 baud with a power level of 2 watts and vertical polarisation. The telemetry will include the following:

Channel 0 Internal temperature
Channel 1 Battery pack temperature
Channel 2 Outside air temperature
Channel 3 Battery pack voltage
channel 5 Air pressure
Channel 6 Rate of rise or fall of BACAR
Channel 7 Engineering data

STORE AND FORWARD REPEATER

The store and forward repeater will record 30 seconds of speech from a 2m up link and retransmit it on the down link. Normal repeater off-set will be used. The up link frequency is 145.200 MHz.

The scouts and girl guides will under supervision of licenced Amateurs be able to use the system and send messages. A few ground control stations will record the down link signals and certificates will be issued to all who operate through the system.

Radio Amateurs assisting the Scouts and Girl Guides will be supplied with brief tutorial notes to explain how the system operates and how BACAR simulates a real satellite.

A number of Scouts and Girl Guide groups will have the
opportunity of watching the launch of BACAR while others
will take part in the recovery operation.

HF back up will be provided by ZS6SAT on 14282 and 7080 kHz
with relays on 3660 and 7095 kHz AM.

[Info from Hans van de Groenendaal ZS6AKV]

* SATELLITE OF THE WEEK *
==========
The "Satellite Of The Week" feature is in response to numerous requests
for amateur satellite transponder passband and beacon frequency information.
All active amateur satellites will be covered in upcoming weeks.

Name : AMSAT-OSCAR-20, NASA Catalog Number: 21087, Launched on 29-Jan-90
Orbit : Low-altitude, circular

AO-21/RS14 is a multi-function satellite supporting Mode B analog transponders
as well as a multitude of digital store-and-forward modes. Unfortunately,
post launch electronics problems have confined operations to limited Mode
B transponder #2 communications.

Transponder #2:

Uplink Passband: 435.123 to 435.043 MHz (100 watts EIRP)
Downlink Passband: 145.866 to 145.946 MHz (10 watts Maximum)

CW Beacon : 145.948 MHz (0.2 watts)
Digital Beacon : 145.838 MHz (0.4 watts, FM)
Digital Beacon : 145.800 MHz (2.0 watts, FM)

My vote is for the Larsen mag mount. It's tough, durable, and the antenna
works as well as any base loaded whip. Mine has lasted fifteen years, and
I know of one larsen that still worked from beneath an upside down
logging truck....your mileage may vary....

2974. ICOM 2410 display

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-21 21:43:09 UTC
From: ker@cbnewsj.cb.att.com
Message-ID: <1991Sep21.214309.14899@cbnewsj.cb.att.com>
Source record: 293341

Today I had the opportunity to disassemble the front section of an ICOM 2410A
to take a look at the display. The current model with the orange letters
on a black background is indeed a liquid crystal display (LCD).
It is backlit by four small incandescent bulbs and the light is
transmitted behind the display via a piece of plexiglass. Apparently the
active LCD segments become transparent when active, allowing the light to
pass thru producing a lighted digit. Some people have felt the display is
LED or flourescent but it isn't.

The reason for my dissection is to gain confidence that what ICOM and
the 2410 service manual indicates is true, that is, the current display
can easily be replaced with the more conventional black numeral on orange
background LCD display when it becomes available later this year.
For those unfamiliar with this subject, the first 2410s in this country
have the orange on black display but later this year the display will
change to be identical to the one shown in the 2410 adds and similar
to the display on the IC2400. The problem with the orange on black display
is that it can become "washed out" in direct sunlight, resulting in a
unreadable display.

Although I haven't completely replaced the display (yet!), I don't feel
it will be difficult. I had to:

1.) Remove both sides of the case

2.) Remove 4 screws that hold the front section of the radio to the rear. This
front section is about 1" deep. You can optionally unplug the front section
of the radio from the rear via two thin ribbon cables but I didn't want
to risk it. They looked too fragile.

(By the way, at this point you can cut the appropriate diodes on this
front section to extend the receive coverage)

3.) Remove the VFO control knob and two volume control knobs.

4.) Remove a hex nut behind the VFO control

5.) Remove 4 screws that held the front plastic bezel and then remove
the bezel.

At this point the LCD is very visable at the front of this module but we're
not done yet.

6.) Remove a rubber decorative seal that went around the display.

7.) Remove the nuts holding on the microphone jack and the two volume controls.

8.) Now at the rear of the display you can see a small PC board with 3
small screws that hold a metal piece that slides around the front section.
It's hard to explain but you'll know what I mean if you open the radio
and see the piece of metal that the nut for the microphone jack tightens
onto. Remove these 3 screws (watch out, one is right next to the lithium
battery) and then remove the metal piece.

Here is where I stopped.

It appears that all that remains is to bend 5 metal tabs that are part of
the frame for the LCD display and remove the frame. The display should
come right off now because it is electrically connected to the rest of the
module by what is known as a zebra strip; a conductive piece of rubber that
connects the many circuit board contacts to the display itself. The
new display should drop right on, followed by a reattachment of the metal
frame. Reverse all the steps above and you're done.

I emphasize I've not taken this to completion; the new display is not
available yet, but everything checks out as to the ease and feasibility
of the display upgrade. I will report to the net when I actually
do the complete upgrade.

2975. Re: Standard Radio C228a HT

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-21 22:11:51 UTC
From: yoony@aix.rpi.edu
Message-ID: <7hsnl7b@rpi.edu>
Source record: 293342

Just as an added information. Standard also makes a 2meter/440 rig that is an exact twin to the C228 called C528A. Standard also makes a 440/1.2Ghz hand held that also looks like the two previously mentioned radios. But I don't think that they export it to the U.S. Since they don't have 220 band in Japan they do not market the C228 in Japan, but the C528 and the 440/1.2 radios were the hottest selling dual(Twin) band hand held radios in Japan. Out sold IC-24, TH-75, and so on. They also came out with an ultra micro 2 meter and 440 single band radios that's about the size of the IC-2SAT. I think the capability's pretty close. I own the 2/440 Hand held and it's a very good radio and I am very satisfied with it. The only difference between the 2/220 and 2/440 rigs, other then the band, is that the C228H has a single DTMF telephone memory, and the 2/440 rig does not.

2977. RTTY using HamComm

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-22 00:00:59 UTC
From: sgingras@neumann.waterloo.edu
Message-ID: <1991Sep22.000059.5582@watmath.waterloo.edu>
Source record: 293344

I've recently acquired a small Sony SW7600 shortwave radio and decided
to build the small interface to "sample" the audio through my PC's serial
port. Aside from the major problem of trying to find a station with all
the RF noise generated by my computer (25MHz PC) and my NEC MultiSync
monitor, I don't know how to recognize the kind of data that I receive
and I haven't been able to decode anything using the HamComm software.

Thinking that maybe 45, 50, or 75 Bauds Baudot would be common, I tuned
to a number of stations without being able to decode anything at all.
I found a lot of stations in the 4 to 7MHz area, most of them with about
800Hz spacing between the two tones. At some other place I found one or
two with about 200Hz spacing.

My main problem is that I cannot tell whether I receive garbage because of
the poor quality of my signal, because the data just isn't text, because
it's not Beaudot or Ascii, or because I don't have the right baud rate.
Does anyone know how I could guess the type of data I receive?

I would greatly appreciate any help or suggestions to any of these problems.
I would particularly appreciate if someone could point me to a strong signal
which I could easily decode (I'm in the area of Toronto, Canada).

Thanks!

"I get my kicks on Route 66" - really - I live on it

From: smb@ulysses.att.com (Steven Bellovin)
Subject: Re: A movie UL
Lines: 12

A friend of mine from grad school actually pulled a similar stunt, or
at least claimed that he did. He was in the orchestra for a school
performance of ``South Pacific''. There's one scene where some folks
are stranded on an island, and they radio for help. My friend,
being the clarinetist, was told ``just send a single tone, starting and
stopping to make it sound like Morse code''. He did -- but since he
actually knew ``Morse'' code (international code, actually), he sent an
obscene message. Everything was fine for the first few nights; the
last night of the show, one person in the audience started laughing
uncontrollably. The director went to my friend later and asked, ``That
was really Morse code, wasn't it?'' My friend nodded; he was never
asked just what he'd sent...

At the local Hamfest today, I saw the 440/1.2 Gig version of the HT. Its
seems a little exotic for the U.S. ham market but the rep explaind that most
the repeater work in Japan is on 1.2 G with a little on 440 and almost
entirely simplex on 144. None of the vendors had any units or pricing yet.

Interesting note: The charging and external power jacks on the unit are
postive shield, center ground. My Icom 3SAT uses the exact same connector
with reversed polarity. I find this annoying and potenitally destructive.

It also that makes things hazardous for cables lying around the mobile or
negative ground shack. I wonder if the case is positive ground
(that couldn't be that stupid could they?). The last gear I had that was
like that was the Kenwood SW200 SWR bridge. I rewired that sucker quickly.
Making the C228A conform to my local standard won't be easy.

The unit will not charge the battery while on external power, a feature
I have grown to love on the SAT series.

Many of the larger vendors had stocks of equipment and accessories for
all the units. I also saw 4 or 5 of the dual banders on peoples hips.

Message-ID: <1991Sep22.123049.27967@usenet.ins.cwru.edu>
Source record: 293353

```
from our .help files:

Telenet Address:
================

martini.eecs.umich.edu (141.212.99.9)

Name & Location of System:
==================================
Geographic Info. Server
University of Michigan, Ann Arbor

What Does It Contain?
=====================
Geographic information on all US cities, counties, and
states, as well as some US mountains, rivers, lakes,
national parks, etc. A few international cities
have been included. (See below for details)

Are There Services Unavailable to Users?
========================================
No.

Must I Have a VT100 Emulation Capability?
=========================================
No.

How Do I Log In?
================
Log in is automatic, but it is not going to prompt you
for ANYTHING once you get there. Once the login is complete,
and the cursor is staring at you, just type in the name of a
town (like: Clawson, MI) and it will do its thing. (See below
for what "its thing" is.)

How Do I Log Out?
=================
To exit the server, enter "stop", "end", "quit", "bye",
"exit", "logout", "logoff", or control-D.

Anything Else I Need to Know?
=============================
Queries should generally look like the last line of a postal
address, as in "Ann Arbor, MI 48103".

All these queries will also work:
1) ed(1)-style regular expression, like "[Bb]os.*n$"
```

2) A city name alone, like "Ann Arbor"
3) A ZIP or ZIP+4 code alone, like this: "46556", "48103-2112"
NOTE: only the first 5 digits in a ZIP+4 code are used.
4) As in 1) or 2) but with a state name or abbreviation, like
this: "Ann Arbor, MI", "Los Angeles, California"
5) As above but with optional nation name or abbreviation, like
"Toronto, , Canada". NOTE: there are currently very few
foreign cities.

Punctuation, white space, and upper/lower case are ignored.
Any reasonable state/nation abbreviations are recognized.

Here are more example queries:

"Ann Arbor, Mich" "48103" "annarbor,mi" "Paris,,France"
"Mammoth Cave National Park" "mount mckinley"
"lake michigan"

If a query fails, try expanding abbreviations (e.g. change "Mt."
to "Mount", etc.

Interpret server replies as follows:

0 <city name>
1 <county FIPS code> <county name>
2 <state/province abbreviation> <state/province name>
3 <nation abbreviation> <nation name>
A <telephone area code>
E <elevation in feet above mean sea level>
F <feature code> <feature name>
L <latitude DD MM SS X> <longitude DDD MM SS X>
P <1980 census population>
R <remark>
T <time zone>
Z <postal ("ZIP") code>

A final bit of information:
There are no page breaks when information
appears on the screen, so be prepared for text
to go careening off your screen very quickly.
End of File
==========

A very useful reference tool.

Also, keep in mind that the radiation within the ham bands can still cause
trouble. It may mix with other sources on the aircraft or on the ground
and end up on a sensitive frequency.

>Dean Youngquist

I have also purchaced the Alinco DJ-160T It is a super rig, But the
manual is really poorly written. The DTMF DE-code is not included in
the rig. It is like a $50 add in card. It does have EN-code thoguh. you
push and hold the FUNCTION key and HOLD the ^# key (it also says TSQ
set) and turn the dail to the Tone you want (i belive the common one
around here is 107.2) and let go. Then push and hold the function key
and the DAIL CH/D key (also says ENC/TSQ) and ENC will pop up on the
display. I Know nothing about the DE CODE since i was too cheap to buy
the option and found no use for it. I just got passed my
No-Code Yesterday, and have not yet recived my liecence (What a wait:))
or i would give ya my call letters.

I'm not familiar with your receiver or the Hamcomm software, but here are
a couple of points to ponder....
1. Almost all amateur RTTY is transmitted lsb
2. Standard mark-space shifts are 850, 425, 170 Hz
3. You need to have a stable receiver that stays on freq +- 10-15 Hz
4. Most amateur RTTY is transmitted at 60 WPM (45.5 baud)
5. Both the mark and space need to be within the audio pass band of the
receiver.
6. On the amateur bands you will also find ASCII, AMTOR and packet.
Perhaps there is a ham store in your area, and someone could let you
listen to the different sounds of the signals.....

Source record: 293367

You're thinking of the GE Fastrak cassette recorder.
They high pass filter the audio at 300 Hz. or so and
then chop the audio at something like a 20 Hz. rate.
So far example at the 2X speed, the tape runs at
3 3/4 IPS, and the duty cycle of the chopping is 50%.
The chopped audio is then run thru an analog sampler
and each piece is played back at half the speed it
went into the sampler at, which means it is now back
to normal pitch. This makes each piece take twice
as long and that fills in the gaps. At less than
2X speed, the duty cycle is adjusted commensurate with
the speed so that at 1.1X speed, only 10% of the audio
is chopped out.

"On the Beach" was structured around some Morse code coming from
the location of a power plant in North America which was supposedly
UNinhabited after World War Three. After sending a submarine thru
radiation-infested localalities, etc., our hero located the code
source: a soda-pop bottle lying on a key and being moved by wind
blowing a window shade.

The hero then used the key to radio back to the submarine what he
had found. It's been almost 30 years since I saw the movie, but
he sent real Morse code at about 15 wpm.

RACESBUL.188 DATE: September 23, 1991
SUBJECT: DRILL OR EXERCISE REALITY, Part 1/3

The following was written by April Moell, WA6OPS, long experienced in medical and disaster emergencies. She gives you, both government and volunteers alike, advice from the perspective of the served agency. I have paraphrased her original memo to hospital disaster responders to apply to communications responders in virtually any incident.
--- S. E. Harter, KH6GBX

DRILL OR EXERCISE REALITY

1. It will never be what you expect.
2. Go prepared for anything. You never know where you might be operating, or for how long, or under what circumstances. You could be at the command post in a basement or in the field. Your fellow ham may drop his or her handie-talkie coming into the building.
3. Introduce yourself to the person in charge of your area. Don't be afraid to ask who is in charge if you aren't sure. You need to quickly brief that person as to your capabilities. Let them know to where you can provide them radio links. Do not assume that they know what you can do.
4. Just like we have many hams each year that are new to the drills or are in a different hospital (or EOC) than before, the hospital (or EOC) are usually in the same situation. They may have brought in staff from other shifts or locations to learn about the disaster plan. New administration staff may be getting their feet wet for the first time as the person in charge of the command post. In many cases it may be the first time they have seen a ham in their incident command post -- at best, in some exercise a year or so ago. In other words, DON'T ASSUME THEY WILL THINK YOU ARE WONDERFUL AND IMMEDIATELY KNOW WHAT TO DO WITH YOU.

Luckly they both have a diode to short the positive to ground if the polarity is reversed. At least the radio should survive the experience.

John, I think you have the terminology a bit mixed up.
The DTMF En-code that you are talking about is actually called PL, CTCSS and
Tone encode. This is a subaudible tone that goes out with the audio.
The DTMF decode that he's looking for has to do with the touch tone telephone
tones that are used to dial in an autopatch. My DR-590T has that capability
but I'm sure the directions to do so are quite different from the HT. The
DTMF decode function actually listens to the tones and tells you what the
tones were(1,2,3,...#,*, etc).

I have the feeling that repeaters on 2meters are not allowed in Japan.
All of the ICOM 2 meter FM rigs were unable to operate with a shift.
I had once purchased a Japanese version of the IC-2SAT and the duplex function
was not available until I did some modifying.
The Standard C228H is negative ground to the case. It would have been nice
to be able to charge through the power jack. I had some friends that modified
their radios so that it can be charged through the jack but I don't have any
data for it.

2994. Extending Xmit Freq Range on Kenwood TM-741A ??

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-23 04:06:13 UTC
From: buaas@trout.nosc.mil
Message-ID: <9109230406.AA01532@trout.nosc.mil>
Source record: 293365

Does anyone have the details of extending the transmit frequency range in the new Kenwood TM-741A? There is a green jumper wire W1 just behind the external speaker connector on the CPU board, labeled on the schematic as "OVER RANGE". Cutting it seems only to cause the next power-up to reset the unit. I'm interested in getting MARS performance from 2M, and 420-438 xmit.

thanks in advance. Bob K6KGS

That's right. I think it was described in QST quite some years ago for operation as a 4 element vertical array. The legs of the towers contained the vertical dipoles for 40, 20, 15 and 10 (if my memory doesn't fail. As a last resort I might look the reference up.

Rick Sterling (cbmvax!sterling@RUTGERS.EDU) writes;

<...FCC rules permit aeronautical mobile operation....>

And the British Amateur License explicitly forbids it. And the FCC rules as posted here say that the operator of the plane has to give permission, and that the pilot is not the operator in this case. By all means operate from your Cessna, just don't do it on commercial airlines.

<...As long as the FAR has arbitrary rules I think the debate will continue. ...>

I have no objection to the debate. I have strong objections to people "experimenting" by operating on commercial airliners. Your right to wave your fists ends at the tip of my nose.

<...I'd suggest you stop flying. Life is not 100% risk free. Flying will never be 100% risk free....>

Indeed. But why add to the risk by doing something which (a) is against the rules (despite what you say - most people posting here don't seem to get the operators permission, and are therefore operating illegally) (b) demonstrably A Bad Thing (as per the examples posted here of EMC problems) (c) only a hobby anyhow?

<...Courtesy and good manners are universally appreciated and beside that I'm ALWAYS nice to anyone pointing a machine gun at me. (Seoul airport... and his finger was on the trigger)...>

You don't have to go as far as Seoul. The guards at Paris Charles de Gaulle are notably lacking in humour - You name it, it goes in the X-ray, like it or not!

Personally, I'm much more frightened by inadequate security than irritated by strict.

73,

Hugh, G0CNR.

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 028 (OPDX.028)
September 23, 1991
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn Packet Cluster Network, JH1FDP, WK3N, AA6BN, KD8V, K8YSE and OH0XX for the following DX information.

3D2, FIJI ISLANDS. Seiji, JH1FDP, informs OPDX that several JA ops will be active from here between October 4th to 9th. Look for 3D2HA=JJ1AEB, 3D2NO=JR1WLO, 3D2ST=JA5VBH, 3D2SY=JN1GAG, 3D2TR=JN1BMX, 3D2YI=JI1NJC and 3D2YN=JR1LZK operating on 160 to 6 meters CW and SSB. QSL to Yasunori, JI1NJC.

3W/XV, VIETNAM. The gang that was active from XY-land is now operating from Vietnam. There is no word on how long they will be there, but look for 3W3RR, 3W/4KOT, XV3UU and XV9MA. Check on the low end of 15 and 20 meters for CW, 14195 and 21295 kHz for SSB and around the times of 0000z or 1100 to 1830z.

3X, REPUBLIC OF GUINEA. 3X0HNU was active this weekend on 12 meters around 1500z. By the way, this station is good for DXCC.

4D, PHILIPPINES. A group from the Philippines will be using the special callsign "4DMCI" from Camiguin Island located in the central part of the Philippines. Operations will be from October 2 thru 6 on 10-40 meters. No QSL info was given.

C9, MOZAMBIQUE. Lots of activity by C9TDM and Rudy(DK7PE), C9RAA. All of the activity by Rudy is CW on 1824, 7005, 10105, 14024, 18070, 21005 and 28024 kHz around 0000 to 0330z and again around 1300 to 1400z. C9TDM can be found on 28515 kHz around 1400z.

KH4, MIDWAY ISLANDS. Cliff, KH4AF, is active on 12, 17 and 30 meters with 100 watts and a log periodic. He plans to be there for about 1 year. QSL to Box 19, FPO AP 96516. Cliff also reports that KH4AE is also active on 28400 kHz.

OSCAR 13. Stations heard and worked: FP9SPM, GD7BGA/P, GT7ITV/P, HG1WD, LZ1MC, SV5/PB0AIO and T7/IW4CHN.

PIRATE! Back in February, a station signing VU2TU/VU7 was reported to be active from Nicobar Island. Tom, KD8V, received a note from VU2TU stating it was not him, it was a pirate using his callsign. Also, he

does not have any radio equipment.

RTTY. Station heard and worked over the weekend.
4X6UO 14085/0450z TA5C 28086/1358z
C6AAA 14088/1358z VP5JM 28088/1400z
GI3KVD 21088/2031z Z21GZ 28084/1512z
KG4DD 28083/1409z ZC4AB 14085/0336z

S2, BANGLADESH. Erik, WZ6C, signing S21NQ, showed up September 22, on 24947 kHz around 1330z, long path. Then at 1520z, Erik moved to 18110 kHz and began working JA stations, then stateside stations. He also continues to be active on the lower portion of 15 and 20 meters CW bands around 0000z. QSL via W4FRU.

TT, CHAD. The station signing TT8SA was active on Sunday morning on 28553 kHz around 1300 to 1430z. QSL to F6FNU.

YB, INDONESIA. YB0WR, Lumban, will be active this Fall and Winter on 80 and 40 meters. He works 80 meters SSB with a 4 element beam and on 40 meters SSB with a 2 element beam. Lumban still needs Iowa on 80 and Delware on 40 for his 5BWAS. Contact K8YSE or Lumban direct if you can help him with his needed states. You can also find him active on 12 and 17 meters. QSL to his CBA.

ZA, ALBANIA. On September 17th, Amateur Radio became active again from Albania. The training and operating at ZA1A will continue until October 7th. Opening ceremony was attended by high administrative officials from agencies including Albanian Defense. With 50 people present, the ceremony was broadcast on Tirana TV. The first contacts made by the Albanian students were with IN3CKK (CW) and IT9HZC (SSB). It was first reported, that operations were being conducted at the PTT headquarters with access limited to operations between 0530 to 2000z. On Friday, September 20th, the ZA1A group must have received permission to operate after 2000z. Operator OH2BH on 14145 kHz spent about an hour on each call area, using a unique technique for cutting the pileups down and with a spread of only 20 kHz wide. (ex.A8,K8,N8,W8) This technique seems to be satisfactory to all DXers. Another station was also active at the same on 7045 kHz operating SSB listening up in the USA phone band. Sunday, around 1600z, they were active on 28345 kHz for a brief period, but had to leave because of TVI and later around 2057z there was a report of activity on 18070 kHz. So far the DXers/Trainers are doing a class job in controlling and working down the pileups.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

Message-ID: <9109231255.AA01054@NADC.NADC.NAVY.MIL>
Source record: 293247

Reading the DX Bulletin on this week's net? Ever wonder if you're pronouncing those wierd country names correctly? Here's a guide to some of the "toughies" listed in this week's ARRL DX Bulletin No. 41:

BOTSWANA - bot SWAH nah - Republic of south central Africa.

CROZET - crow ZAY - Five small islands in the south Indian Ocean.

GLORIOSO - glor ee OH so - Group of small islands in the Indian Ocean.

JAN MAYEN - YAHN MY in - Island between Norway and Greenland.

LAOS - LAH ohs - Country of southeast Asia.

MOUNT ATHOS - MOUNT AATH us - Independent monastic community in Macedonia, Greece.

MOZAMBIQUE - mo zam BEAK - Country of southeast Africa.

NIUE - knee YOU ah - Island in the south central Pacific, east of Tonga.

SOUTH ORKNEY - SOUTH ORK knee - Islands in the south Atlantic, southeast of Cape Horn.

TROMELIN - trawm LAA - Small French island off northeast Madagascar.

If no one is reading the bulletins on your net, why not try it? Tell Net Control that you have bulletin information for the net, and that you will stand by until the end of the net to read them. The stations checking in will appreciate it, believe me, and it's fun to do!

If you are reading the bulletins, you may qualify for an ARRL "Official Bulletin Station" appointment. Contact me for details.

Source record: 293363

The ongoing debate is wonderful. It reinforces my belief that "high-end" audio is 90% science and 10% subjectivity. The real "tweakies" believe that audio is not suitable unless it comes from a granite mounted turntable feeding a vacuum tube preamp and amplifier, "straight wire" into a massive bass reflex speaker system. t
I worked in an audio shop while I was in high school and learned one basic lesson. If it sounds good to you, nothing else matters. You cant hear specifications. If zip cord is your thing, go for it. If you cant live without monster cable, then knock your socks off.
After a weekend of listening to (and working for my *last* counrty) ZA1A, I want to thank the 20,000 of you who did not make comments on his transmitting frequency. The 40 of you who did feel the need to behave as children, I encourage you to become involved in "high end" audio.
By the way, my favorite definition of "truism" is "too unimportant for mention."

>Does anyone know what frequencies the gang at ZA1A are hanging around. I have
>had to luck in finding them..... Thanx.... Gary KE9MI
>
The following is a list of freqs I have wkd/hrd them on. The operating
times are approximate, but are based on actually wking them and casual
monitoring of their activity and/or watching the tube. The freqs are pretty
accurate, though.

BAND MODE Their TX They Listen Approx. Times
---- ---- -------- ----------- ----------------
10M CW 28020kHz UP 5-15khz Mornings > 1300Z
10M SSB 28345 " "
15M CW 21020 UP 10-30 "
15M SSB 21295 300-350
20M CW 14020 025-050 "
20M SSB 14145 14185-200/200-220 MOST OF THE TIME
40M SSB 7045 7200 0000Z
40M CW 7003 7009-7025 Last nite! 2200Z
80/75/160 No cnfmd activity, YET.

These freqs were also posted on the Tri State PacketCluster(tm), W2JT,
(Parsippany, NJ).

NOTE: Last Friday the operator said they were operating from a
gov't bldg & opeartions will be confined to 0530Z - 2200Z.

BUT, last nite they were on 40M CW almost all nite (EDT), 2200Z-0500Z.
They also got off 10M PDQ (staying only couple hrs) cuz of TVI.

I've noticed that the operation has concentrated on 20M SSB, the band/mode
most likely to produce mega-contacts. They then appeared on 15M CW, then
15M SSB. Friday, they showed on 40M SSB and last nite (9/22) they made
their 1st appearance on 40M CW. If they follow this pattern they will
most likely appear on 75/80 & 160 later this week, maybe as early as tonite.

Since they are trying to "demo" ham radio to the new hams of Albania
it would behoove us to mind our manners. The pileups have been horrendous,
but for the most part, well-behaved. (I know this may start some flames:
Tell it to the judge).

In no way is the above gospel. Suggestion: tune, tune, and tune some more.

Good luck to all & above all HAVE FUN! 73 - Walt - K2WK.

3003. Extending Transmit Freq Range in new Kenwood TM-741A ??

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-23 14:33:19 UTC
From: Robert.Buaas@Eng.SUn.COM
Message-ID: <9109231433.AA24170@rats.Eng.Sun.COM>
Source record: 293372

Does anyone have the details of extending the transmit frequency range in the new Kenwood TM-741A? There is a green jumper wire W1 just behind the external speaker connector on the CPU board, labeled on the schematic as "OVER RANGE". Cutting it seems only to cause the next power-up to reset the unit. I'm interested in getting MARS performance from 2M, and 420-438 xmit.

thanks in advance. Bob K6KGS (buaas@nosc.mil) (714/962-4010)

I believe what your are referring to is the "cherry", a plastic film placed on faceplates to protect them from harm during the manufacturing process. Personally, I remove it first thing. Although it might look good for a while, it still looks lousy if it gets torn.

```

Exactly right.

I suppose it's somewhat interesting HOW HTs interfere with aircraft radios, but the far more important fact is that they DO interfere.

I'd suggest that people stop random theorizing that "proves" that HTs can't interfere, because the fact is that they do; I know from experiment.

Some years ago I went on a trip with a pilot/ham friend in his Cessna 152. At some point I turned on the HT -- a Kenwood TH21 running 1 watt (or perhaps it was on low power, which is 150 mW). The red flags on the nav equipment popped up the moment I hit the transmit switch. The pilot didn't mind since the transmissions were short and at that point he could do without the nav for a few moments...

I don't know if it was fundamental overload, spurious emissions, third order intermod, or whatever; the key piece of information is that there WAS an adverse effect, one that definitely WOULD be a hazard at other stages of the flight.

>functions and the manual is really confusing. Its supposed to have a mode
>which displays incoming DTMF tones. Can anyone help with this ?
>
>youngqd@jacobs.cs.orst.edu
>Dean Youngquist

Yes, DTMF decode does work on the DJ-160T, you just have to know how.
This is what you do. Put the radio in DSQ mode OR set the unit in
DIAL mode. Example, enter any number in dial channel 1, the DIAL
indicatior will appear in the lower left on the display. Now if any
DTMF tones are received, press the "D" key (labeled DIAL something),
and view dial channel 3, presto, those are the tones received. Note
that decode does not work while you are viewing the decoded tones.
You have to wait till after the tones are received, then view them.
Hope this helps,

Steve Kuo, N8OPH, sdkuo@oakland.edu

3007. IC-970A: Any good?

I'm looking for a list of mods for both the ICOM R-7000 (especially one that restores 1 GHz -> 1.025 GHz reception) and the AOR AR-3000 (especially one for IF output), reviews of the latter (I know about the MT review in July 90.), and head-to-head comparisons of the two.

Are there other UHF/VHF+ receivers that I should look at? (I've heard that there's a Yaseu and suspect that there's a Kenwood, but neither are mentioned in the HRO catalog.)

3010. "Butterfly" antenna info wanted

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-23 18:14:05 UTC
From: jmccombi@bbn.com
Message-ID: <66461@bbn.BBN.COM>
Source record: 293233

I am considering purchase of a Butternut Butterfly beam antenna for 20-17-15-12-10 meters (adverts say: acts as dipole on 17, two element beam for all others). It appears to have features that I find most attractive: it's small, turns on TV rotator, etc. Is this antenna any good? Are the claims in the advertisement accurate? Does it need a tuner (the ads lead one to believe no)? Should I spend my money on something else of comparable size? If so, what?

All comments appreciated. Please e-mail directly to me; I will post a summary to the newsgroup.

I'd worry more about pilots such as those that fly for NORTHWORST who seem to think that you can never have too much to drink before you fly. Or I'd worry about airlines that think a false signature here, a little lie there never hurt anyone; when it comes to maintanence related safety.

There, I feel better now that I have added nothing constructive :-)

Source record: 293246

In rec.radio.amateur.misc, dstock@hpqmolm.sqf.hp.com (David Stockton) writes:

> Loudspeakers actually require the lowest possible drive impedance :

Solid-state feedback-type amplifiers have very low output impedances --
in the milliohm range. Supposedly, speakers are optimized for such low
impedances. As David says, the fact that the speaker is nominally 8 ohms
does not mean it requires an 8 ohm driving impedance.

On the other hand, old-fashioned tube-type amplifiers really did have
higher output impedances. A pentode vacuum tube typically has an output
impedance in the hundreds of kilohms range. With the small amount of
feedback they used, I believe the output impedance was rather high.

So did they design speakers differently in the old days? Will modern
speakers designed for low driving impedance work properly with tube-type
amplifiers? Will speakers designed in the tube days work properly
with modern solid-state amplifiers? IMWTK

Message-ID: <1991Sep23.200001.25133@news.larc.nasa.gov>
Source record: 293232

I was on 10 meters yesterday during much of the afternoon and noticed
an interesting phenomenon. Around 1400 EDT (1800 UT), many
stations from the midwest developed distinct echoes (I'm on the east coast).
This continued for some time (about a half hour, if I recall correctly).
What was happening here? Was there some sort of backscatter occuring?
This, however, wouldn't account for an appreciable time delay.
Long path sounds sort of farfetched. Any ideas would be appreciated.

How many people remember the song "Dear Miss Morse" by
a group called Pearls Before Swine? The lyrics included
a brief piece of Morse code, done simply by the singers
saying "dit" and "dah" in step with the beat of the song.

It was quite apparent that the Morse part was decided on
first and the song written to provide the proper tempo
for the Morse message. After some brief air play, radio
station program directors (probably with the assistance
of hams on the staff) figured out what exactly was being
said in Morse code. For the curious, it was a word of
just four letters. Imagination should fill in the rest.

3017. Re: Can you rejuvenate old radium dials?

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-23 20:21:37 UTC
From: M14494@mwvm.mitre.org
Message-ID: <91266.58898.M14494@mwvm.mitre.org>
Source record: 293234

---------- Original Article ----------
>..is it feasible to rejuvenate...

You don't want to. The radiation level from the radium can be dangerous if you are near it for a long time. I had an aircraft sextant with radium dials, and it ended up being hauled off by the DoE for disposal it was so hot. If some of the radium were to come off the dial while you were fooling with it, and you happened to inhale it (even a small dust-speck of it) it would be 73s and SK. If the dial is still sealed up, leave it alone. If it's not, lose it.

3018. IC-W2A initial matrix configuration???

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-23 20:45:25 UTC
From: charlie@mof.govt.nz
Message-ID: <1991Sep24.084525.476@mof.govt.nz>
Source record: 293267

Hello everyone,
The initial matrix inside my IC-W2A reveals something I thought interesting. There are only two diode packs there when according to the circuit diagram there should be three. D15 is there, labelled MU which means its a MA132WK, D16 is there, labelled M3U which means its a MA132HK, but D22 is nowhere to be found. I can clearly see the solder pads where it should be connected, & on the circuit diagram D22 is shown as used for ALL models.
The question is, why is it missing & what is its function?
The W2A will TX from 140 - 170Mhz & 400 - 480Mhz Ok. Any thoughts on this one will be appreciated.

Can anyone give me some information about the transistor
PT4318A from TRW ?

I have checked the available databooks and the main Swedish
dealers without any success.

Please help !

Thank you !

3021. Airborne radios

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-23 20:59:01 UTC
From: hwd@pyuxa.UUCP

My recollection is subject to the effects of time, but I remember the aftermath of an air crash over New York City in the 1950s or early 1960s. Two planes, obviously one or both of which were off course, collided in mid-air and came down in Brooklyn, New York. The cause of the navigational error was alledgedly a portable radio being operated in the passenger section by a boy. It was after that incident that I saw regulations promolgated concerning the use of consumer radios in the cabin of airliners. Can anyone corroborate the story and circumstances?

My concern is this: If aircraft navigation and communications equipment can be disturbed by passenger radios operated in the cabin, how can we be assured that nothing untoward will happen when a plane passes so close to megawatt radio transmitters that are typically found near airports or flight paths? Can we risk another Lockerbie incident caused by a terrorist/martyr tuning a Walkman?

Sb: Re: DJ160 DTMF Decode File

I received a message about the DTMF decoding on the DJ-160, and I
thought
I should tell you that the process is not that complicated.

1) Put radio on frequency to catch tones to be decoded.

2) Push the DIAL CH button (lower right corner of keypad) The LCD will
indicate
the channel currently selected. The channel must be 3 to decode DTMF. If
it
is not Channel 3 then use the M button (top left) to change selected
channel.
Once you have the M3 in the window you can push the DIAL CH button again
to
bring the display back to indicate the frequency. The word DIAL will
remain
in the lower right corner of the LCD window.

From this point on any DTMF will be stored in MEM channel 3, but you can
not
recieve DTMF while you are looking at MEM channel 3 , you must be
looking at
the frquency being displayed while decoding. To see the decoded data,
just
push DIAL CH and read the displayed data. Use the frequency knob to
rotate

the stored DTMF tones that do not appear. The radio will store 16 digits
on
each transmission, but the window will only show about 6 at a time. As
the
message indicated, any new data will over write the old...

3023. Monthly Solar Terrestrial Review for August, 1991

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-23 22:27:30 UTC
From: oler@hg.uleth.CA
Message-ID: <0094F14A.E477AFA0.31083@hg.uleth.ca>
Source record: 293242

** MONTHLY REVIEW OF SOLAR TERRESTRIAL ACTIVITY **

Data Released by the
Space Environment Services Center, NOAA

MONTHLY ACTIVITY SUMMARY AND SOLAR CYCLE OUTLOOK SEPTEMBER 1991 - MARCH 1992

We are now in month 60 (exactly the fifth year) of solar cycle 22.
Solar activity levels observed in August were some what similar to those achieved in July, but with a few exceptions. While both periods recorded a total of 35 energetic events, only 4 observed in August were classified as major. This was a decrease of 60% from July and a 74% decrease from the levels observed in June. The average daily sunspot number rose by 3% while the average daily 10.7 cm flux decreased by 1%. The slight increase in the sunspot number did not affect the tentative solar cycle 22 maximum of July 1989 as based on this index.

Activity was elevated during the first week of the month as Region 6757 (N22, L=246) dominated the scene. This active center grew from a simple bipolar group of only 10 millionths of the solar hemisphere when first observed, to a large, magnetically complex area measuring 1050 millionths six days later. It produced numerous moderate level flares and two major events during this time. The major events consisted of an X1/2B flare at 02/0318 UT, and an M7/2B flare at 03/2241 UT. Neither of these flares produced type II or IV radio sweep signatures and the radio burst at 10 cm measured only 370 sfu. Activity dropped significantly between 8-15 August with the 10.7 cm flux falling to its lowest levels since April. This lull was broken however, by the rapid emergence of new flux from the southeast quadrant of the disk which brought radio flux levels back up to a peak of 290 by 19 August. Moderate to major flare activity returned on 16 August when Region 6786 (S10, L=021) produced an M6/1B flare at 16/0621 UT. Additional moderate activity was attributed to this area on the 22nd and 24th. Region 6805 (N22, L=245) produced the final major flare of the month just after northeast limb transit. An X2/2B flare erupted from this area at 25/0115 UT. Associated with the event was a 10 cm radio burst measuring 2100 sfu which was followed by a strong type IV radio sweep.

Only one satellite level proton event was observed during the month.
The event began at 26/1740 UT in response to the X2/2B flare from Region 6805 on the 25th. The event reached a maximum of 240 pfu at greater than 10 MeV at 27/1830 UT and ended at 28/2005 UT.

There was considerable geomagnetic activity again this month. The levels observed during August were generally active. In fact, not one quiet day (A-index of 7 or less) was observed at Fredericksburg during the period. 12 and 19 August were the two most disturbed days. The GOES-7 spacecraft

experienced a magnetopause crossing on the 12th between 1500 and 1630 UT. The disturbance lacked a well-defined solar source but has recurred, to varying degrees, over the last five solar rotations. The disturbance on the 19th also lacked a difinitive source, however eruptive filament activity may have been a possible contributor. Unsettled conditions dominated the mid-latitudes during the period of 23-30 August.

Since late March there have been a near-record number of days at major storm levels or above. This level of geomagnetic activity has not been observed since 1960. Equinox months are usually times of elevated geomagnetic activity, so the period of September-October should continue to be generally disturbed. The best prognosis for solar activity is that there will be periods of enhanced levels through the beginning of 1992.

I don't know all of the details about PVC, but the sort commonly sold for sprinkler systems is rather flexible. A dozen years ago, a member of the local radio club designed a cubical quad for 20 meters using PVC for the spreaders. They turned out to be so flexible that people actually held onto the wire elements in a futile attempt to keep it from collapsing! Fortunately someone had the presence of mind to grab a camera and got off a couple of pictures. That antenna made QST, but no QSO's!

Yes! I bought one, and it is about $2.00. Call the ICOM parts
department, and just describe what you want... I sdon't have their
number, but I think they are in Bellvue, WA.

Source record: 293249

In article <1991Sep23.200001.25133@news.larc.nasa.gov> eckman@eos1.larc.nasa.gov (Richard Eckman) writes:
>I was on 10 meters yesterday during much of the afternoon and noticed
>an interesting phenomenon. Around 1400 EDT (1800 UT), many
>stations from the midwest developed distinct echoes (I'm on the east coast).
>This continued for some time (about a half hour, if I recall correctly).
>What was happening here? Was there some sort of backscatter occuring?
>This, however, wouldn't account for an appreciable time delay.
>Long path sounds sort of farfetched. Any ideas would be appreciated.

How would you characterize the time delay?

1) Long path *is* far fetched, but not impossible. Just unlikely...
*2) Backscatter is the most likely mode of propagation that would
cause this phenomenon...this is very common. It could originate
from the south or from towards Africa at that time of day.
3) Aurora is certainly possible too.....but the voices would sound raspy and
probably wouldn't be described as having an "appreciable delay" as you
mentioned.

A friend of mine, Jon AA1K, once told me one of the most bizarre contacts
he had was with a G station (Jon was living in CT) on 10 meters long path.
Now that's doing it the hard way!

Hope some of this helps....

Obeserved at station 50.7 NLat, 7.1 ELon, SEP 21, 1991

NOAA-9: APT 137.62 On
NOAA-10: APT 137.50 *OFF* due to VHF-conflict NOAA-12
NOAA-11: APT 137.62 On
NOAA-12: APT 137.50 On
METEOR 2-19: APT 137.85 *OFF* (orbiting at terminator)
METEOR 2-20: APT 137.85 On (replaces MET 2-19)
METER 3-4: APT 137.30 On *UNUSABLE*

*** METEOR 3-4 shows severe ATTITUDE-CONTROL-PROBLEMS ***
The satellite actively oscillates around the spacecraft-X-axis, alternately
showing the E- and W-edge of the earth. This again leads to switching
from vis- to IR-imagery and back again. There is an additional
deviation counterclockwise around the spacecraft-Z-axis. The problem
was persistent on SEP 22 too and is surely worth to be observed.
NOAA-10-APT will be off until OCT 02 (info: wxsat-mailing-list).
METEOR 2-19 is in morning darkness and switched off, activity is
taken over by METEOR 2-20, now passing S->N afternoon.

3031. Orbital element sets via email wanted

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-24 09:11:57 UTC
From: jaz@uctvax.uct.ac.za
Message-ID: <201030.28df1d7f@uctvax.uct.ac.za>
Source record: 293256

Does anyone know if I can subscribe to a mailing list which includes regular satellite orbital element sets?

My problem is that I cannot ftp from this site and do not have a modem to reach Celestial BBS with. I know that rec.amateur.radio.misc and sci.space get Ms/Mr. Kelso's elements every now and then, but not regularly enough for my purpose.

Please mail me, and I'll summarise if necessary.

JAZ

I bought the Azden 7000 in July 91 for $309. It works
great. Yes it comes with a microphone and the touchpad
on the mike automatically keys the receiver (a nice feature.)

I could not believe the price either. It is a very
good set.

Almost without exception tube amps used output transformers that transformed the load line of the tube down to match 8 or 4 ohms.

>So did they design speakers differently in the old days? Will modern
>speakers designed for low driving impedance work properly with tube-type
>amplifiers? Will speakers designed in the tube days work properly
>with modern solid-state amplifiers? IMWTK

No. And the reason is called *damping factor*. Looking back into a solid state amp the impedance appears to be a virtual short circuit. Looking back into a tube amp the impedance is complex and higher than a couple of ohms at low frequencies. In the old days, loudspeakers were designed with cabinets that acoustically damped the cone. Today, the back EMF into the virtual short of the amp does the majority of the damping. Therefore using today's speakers with a tube amp will result in an underdamped response, it'll sound boomy. And use of a solid state amp with a old loudspeaker will result in overdamping causing a dull muffled sound. These effects are only noticable at low bass frequencies.

Last year at the Willow Run Air Show here in Michigan, the following
frequencies have been said to be active for the Blue Angels.
275.35 - Blue Angels
246.4 - Solo/2-Team
122.92 - Show

Let me know if any of these are active. I haven't tried these myself.

I talked with some design engineers of aircraft nav equipment over the last
couple days. I reported to them the claims made by folks on the this net.
It seems their chief concern was front end overload most commonly caused

by ground based FM broadcast stations. All said that interference with the nav IF's would take significant amounts of RF power at the IF frequency. (Field strengths in excess of 70 db over 2uv).

For the record...

I have over 2,000,000 miles of commercial airline travel
logged over the years since 1963. During that time I operated aeronautical mobile once after obtaining the permission of the pilot. I operated a 2M handheld from the flight deck at 35,000 ft. while flying under VFR.
(this was around 1978 on a flight from Pittsburg PA. to St Louis)
I have operated aeronautical mobile from a variety of private aircraft and once from a military aircraft (F18). In every instance while flying VFR.

Some of what has been expoused in this thread is modern mythology... some of it is a candidate for the Guiness book of records.... some of it fact.

The Federal Aviation Regulations are fact. Obey them. Other coutries have different rules... be aware of them and obey them when you are in their jurisdiction.

I remove all power sources from my radios before boarding commercial aircraft. (except lithium memory backup of course) I do not use the radios during the flight, even for reception.

Someone was asking whether he should buy this antenna:
"
A club I'm in purchased this product and found that it's very
narrowbanded and requires quite a bit of tuning and tweaking to
get it to work correctly. We finally gave up. Your mileage may vary,
but in the end, we decided it was not worth the effort & went with
a 3-element 20-15-10 beam and a 40/80 dipole.
The Butterfly is a very complex antenna system and has many
adjustments that all interact. You should be aware of this if you're
planning on buying one.

Al, N1AL, writes:

>On the other hand, old-fashioned tube-type amplifiers really did have
>higher output impedances. A pentode vacuum tube typically has an output
>impedance in the hundreds of kilohms range.

While some pentodes had plate impedances in this range, the power amplifier pentodes and "beam" pentodes had plate impedances much lower. Typically they ranged from 2500 to 4000 ohms.

>With the small amount of feedback they used, I believe the output
>impedance was rather high.
>
>So did they design speakers differently in the old days?

Al probably knows that those tube amps use "output transformers" to match the relatively high plate impedances to the speakers. Generally, a good output transformer would have connections for 4-, 8-, and 16-ohm speakers, unlike today's solid-state, direct-coupled systems which can operate well over a range of 2 to 16 ohms.

>Will modern speakers designed for low driving impedance work properly with
>tube-type amplifiers? Will speakers designed in the tube days work properly
>with modern solid-state amplifiers? IMWTK

I looked for a smiley on this and found none, but I think Al is playing around. So how about this one? When will one of the upscale folks try running 35 6AS7's (plate Z of 280 ohms) in parallel to obtain an output Z of 8 ohms? Wait...maybe it has already been done. Maybe that's where "monster cable" came from; the need to carry the plate current of 35 of these things in parallel! :)

Tube-type amplifiers still used quite a bit of negative feedback, so their output impedance was fairly low, though still much higher than solid-state amplifiers. A vacuum tube amplifier couldn't possibly achieve low harmonic distortion unless the output impedance was less than a few tenths of an ohm. (Unless, of course, a resistor was deliberately inserted in series with the output.) As far as frequency response of the speakers, the output impedance looked like just about zero. So I doubt there was any difference in speaker design.

Tube-type amplifiers used to specify something called a "Damping Factor", which was just the nominal load resistance divided by the output impedance. I seem to recall numbers like 30, which would imply an output impedance of 0.13 Ohms. For solid-state amplifiers, this factor would be so high it would be meaningless.

By the way, the reason more feedback is used in solid-state amplifiers is that transistors are inherently a lot more non-linear than vacuum tubes, so more feedback is required to reduce distortion to the desired level. Note that this does NOT imply that tubes are in any way superior for audio amplifiers. Solid state devices just require more feedback to achieve the same level of distortion. Very low distortion can be achieved with either type of device in a properly designed amplifier. (I don't want to get into a "tubes versus transistors" argument here!)

This is a little off the track of ham radio, but the design principles should be useful for ham radio application.

The Blue Angels flew at an air show in Colorado Springs this past weekend
(plus practice on the Thursday and Friday before that). A friend of mine
says that he heard them on:
275.35 MHz - diamond formation (Blue Angels 1 through 4)
251.60 MHz - solo planes (Blue Angels 6 and 7)

Other possible frequencies that he was previously given include:
142.00, 143.00, 143.60, and 241.40.

348.60 MHz was used here by ground control on the military side of
the field for parking aircraft before and during the show.

Since the area over Brooklyn should be within the controlled area, the airplanes should have been taking directions from the controller and not relying only on radio-navigation. As mentioned before, blocking the NAV receiver should cause a failure indication.

I've been on a plane landing at Frankfurt when the ground became visible out my window after passing the airport boundry and the terminal area was not visible from the runway. They use microwave landing systems but many major US airport apparently don't have it yet. In fact the FAA is not only behind the times on the equipment they require, they are way behind the current technology altogether. The Delta 191 crash at DFW airport likely would not have happened if the plane had been flying for Piedmont because they were using a non-required wind shear indicator and a few seconds would have made the difference.

What bothers me is that the FAA doesn't want it's controllers to have to see lightning and heavy rain and 'decide' that it must be a thunderstorm. The FAA doesn't have doppler weather radar and doesn't want it until the software can make weather decisions. There is a non-profit group at Corsicanna, TX that has a doppler weather radar better than anything the FAA or Weather Bureau has in Texas and the FAA doesn't want to see it for keeping planes from crashing. It's an ignorance and stupidity problem not a technical problem.

>This, however, wouldn't account for an appreciable time delay.
>Long path sounds sort of farfetched. Any ideas would be appreciated.

Although 14:00 local time is a bit late, I would suggest that you
heard the signals travelling round the earth. This can often be
observed during springtime and fall, usually in the late morning
with the antenna headed NE. I have heard my own echos many times,
sometimes even two echoes. Each round trip needs approximately
150 msec. If you can switch from transmit to receive real fast
(or if you have QSK) you can hear them.

A friend of mine once told me he felt somebody was fooling him
during a contest. He QSYed up and down the band to get rid of the
guy who seemingly transmitted at the same time as he did.
It took him half an hour to realize what it reeally was....

I can't remember the details, but I remember a blurb from the
Canadian Department of Transport. It seems that strong FM radio
stations can and do foul up the Instrument Landing Systems used
on aircraft. They had various guidelines for not getting fooled
by such errors. The blurb also mentioned that the department
was getting increasingly concerned about EMI compatibility in
aviation.

From what I've seen of avionics, you can place most of it in the
1950's technology wise. It's more than time for a fresh approach
IMHO.

>he had was with a G station (Jon was living in CT) on 10 meters long path.
>Now that's doing it the hard way!

Now that you mention weird propagation modes, let me tell you of some of my personal experiences. My perspective is from the East coast (NNJ).

Working europe long path from the east coast is routine on both 20 & 15 meters just after sunrise. I don't have antennae for 10M but would suspect it to be a similar experience, lots of echo, since at those hours both short & long path modes may support communication.

Working skewed paths is fun, too. I have worked JA via skewed long-path over Africa, beaming due East, around mid-nite, when you would seldom expect it. You can hear the JA'a working Europeans (short-path) at this time. During contests, when it often appears the whole world is on the air at once, is the best time to check for these strange phenomenon.

Once, back in the 60's (please no hippy/dippy/weatherman jokes) I remember hearing what appeared to be a LDE (long-delayed echo). Since I am a true skeptic, I discount it as a hoax.

Has ANYONE ELSE EXPERIENCED LDE, I'd love to hear from you?

>and to plan for if/when that happens, I need suggestions for a replacement
>I had thought about getting a diamond x-500 or something like that, how are
>those? Is there such a thing as a good gain vertical for 2m?

I got a *measured* 10 db improvement from going to a AEA Isopole instead of a Ringo (note Ringo not Ranger) in the same location fed with the same cable. This leads me to believe that the Ringo has negative gain. I'm currently using a Diamond X50 that seems to be *slightly* better than the Isopole. I also have a Comet 2X4 Max mounted 15 feet higher that I normally use for voice. When connected to the packet station, it is *markedly* better than any of the others. I would expect the Diamond X500 to perform similarly. (note the Diamond X50 is at 50 feet and the Comet is at 65 feet) I really like the Comet and would recomend it to anyone who doesn't live in hurricane prone areas. For those poor souls, the heavier Diamond X700 *might* be a better choice.

(final note: I changed to dual band antennas because packet operation is migrating to 440 locally as well as on 2 meters. Both Diamond and Comet offer single band antennas that claim slightly better gain than their dual banders)

3048. ICOM CI-V Computer Interface??

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-24 16:09:31 UTC
From: discipiow@woods.ulowell.edu
Message-ID: <1991Sep24.110931.1@woods.ulowell.edu>
Source record: 293263

Does anybody have any information pertaining to alternatives to buying ICOM's CI-V level converter for the 735. The CI-V interface allows the radio's microprocessor to be controlled by a connected computer. In recent issues of "QST" and "73" articles have appeared for the construction of level converters for KENWOOD and YAESU radios. Can these designs be used for ICOM's 735? Both the designs show separate lines for microprocessor tx and rx while the ICOM requires only one. Is this due to the collision detection scheme employed by ICOM?

I seem to remember this topic appearing a number of weeks ago. If any of the net users still have the original postings, I'd appreciate copies of them. Please post or E-mail. I will summarize. There is quite a bit of interest on the packet cluster I use, so users there will appreciate it also.

Source record: 293275

about the review of the Drake R8 :

As I was seriously thinking of buying it, I'm wondering if all of the
annoyances with the user interface could be avoided by using the RS232
interface. This way, a much nicer user interface could be created in
software on a PC for example.

Does the information about the RS232 port come with the radio?
If not, is it available from Drake or in any other way?

If it is, then we must see what exactly can be controlled through
the port...

No Impact Expected

MAJOR ENERGETIC EVENT SUMMARY:

Flare Size: Class M6.1/1N Location: S10E88 (Region 6848)
Tenflare: 230 sfu @ 0751-0755UT Times: Begin=0749, Peak=0756, End=0805

Sweeps: Type II (Importance 1) at 0759 UT.
No Type IV observed.

NOTES: This event was impulsive with a double-peak in x-rays. The region
is still too near to the limb to discern any details.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT:

This major flare will not have a terrestrial impact.

Region 6848 is the suspected return of old Region 6818, which produced
two strong X-class flares on its last rotation. It last departed in a fairly
large optical EKI group with a complex beta-gamma-delta magnetic
configuration. This region is too near to the limb to discern any
significant details.

Also of interest was a Type II and a Type IV sweep which was observed
earlier in the UT day (not associated with this major flare). There were no
optical correlations with these events. There is also no strong correlation
with observed x-rays at the time of these sweeps. The Type II occurred at
00:49 UT, while the Type IV occurred at 01:08 UT. A possible source may
exist beyond the east limb, where the new forming longitudes appeared to be
developing on the last solar rotation.

A Potential Major Solar Flare Warning has been issued and will likely
remain in effect as long as Region 6848 continues to be energetic.

Source record: 293273

|>..is it feasible to rejuvenate...

|You don't want to. The radiation level from the radium can be dangerous if
|you are near it for a long time. I had an aircraft sextant with radium
|dials, and it ended up being hauled off by the DoE for disposal it was so
|hot. If some of the radium were to come off the dial while you were fooling
|with it, and you happened to inhale it (even a small dust-speck of it) it
|would be 73s and SK. If the dial is still sealed up, leave it alone. If it's
|not, lose it.

But lots of military equipment had radium dials that weren't sealed;
is there really that much of a radiological risk when you are using
a solution of Zinc Sulfide in some sort of liquid binder material?

As a matter of fact, during the 1950s, the novelty company Johnson
Smith once sold bottles of radium paint!

As for military instruments that utilised LOTS of radium, I was once
told by someone that after World War II, the U.S. military had a whole
warehouse full of Metascopes; these were Infrared to visible light
convertor units with poor resolution capability. There primary use
was to spot infrared beacons. The active element was a phosphor charged
by the radium that upon receipt of infrared energy emmitted light;
he said they made the warehouse 'light up.' This was back during the
1970s when they were considering what to do with them ... probably
buried them on top of those R-390 meters... (Cry!) :-)

3057. New SONY GPS Receiver (FindMAN?)

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-24 18:21:13 UTC
From: jta@kilroy.jpl.nasa.gov
Message-ID: <1991Sep24.182113.17686@elroy.jpl.nasa.gov>
Source record: 293270
Cross-posted to: rec.radio.shortwave,rec.radio.amateur,rec.radio.amateur.misc

Has anyone seen the new Sony handheld GPS receiver, the model IPS-360? It kinda looks like an oversized DiscMan unit. I have a brief article out of some recent magazine that includes a picture of the PYXIS IPS-360 receiver. Says here that it weighs 590g and that Sony will be making 5000 units per month.

Better yet, if someone actually has one or has had experience with one I would love to hear about it.

Please post or e-mail. Thanks!

- jon

3058. Potential Major Solar Flare Warning - 24 September

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-24 18:30:15 UTC
From: oler@hg.uleth.CA
Message-ID: <0094F1F2.EA14FA00.32270@hg.uleth.ca>
Source record: 293178

/\

POTENTIAL MAJOR FLARE WARNING

ISSUED: 10:30 UT, 24 AUGUST

/\

ATTENTION:

The occurrence of a major flare from Region 6848 has prompted us to issue this Potential Major Solar Flare Warning. Region 6848 is thought to be the return of old Region 6818, which was a proven X-class flare producer on the last solar rotation. Further major flares may be possible from this Region. It is still a bit too early to say for certain. However, if this is the return of old Region 6818, persistence would seem to warrant this warning.

This warning will remain in effect for as long as Region 6848 remains potentially energetic. A more detailed analysis of this region will be possible when it moves away from the limb and into a better observational position on the disk.

/\

3059. Re: AUDIO AND ALBANIA, A FOLLOW-UP.

Newsgroup: rec.radio.amateur.misc

Even vacuum tube amplifiers provide plenty of damping. A 4 Ohm speaker is damped nearly as effectively by a 0.5 Ohm source as by a 1 milliohm source. And vacuum tube amplifiers DO have low output impedances. The reason for the multiple taps on the output transformer for different speaker impedances is primarily to allow the amplifier to operate at optimum efficiency, and deliver its full output. Any vacuum tube amplifier without enough feedback to reduce the output impedance to a low value would produce so much harmonic distortion that it could hardly qualify as a "High Fidelity" device.

Here's a brief tutorial on feedback in amplifiers. Suppose you have an amplifer with an open loop gain of 1000, open loop output impedance of 10 Ohms, and open loop harmonic distortion of 10 percent. (These numbers might be typical of a vacuum tube amplifier with the appropriate output transformer.) If you use enough feedback to reduce the closed loop gain to 10, a factor of 100 below the open loop gain, the output impedance will be 0.1 Ohms, and distortion about 0.1 percent. If you want the low distortion, you get the low impedance, unless the open loop output impedance is ridiculously high to begin with. (If the open loop output impedance were higher than the load impedance, the efficiency would be very low. That's what the transformer is for.)

Better recalculate again Walt, Dave is right 10M long path especially between two stations so close is indeed "The Hard Way" 10m rarely stays fully open (F2 style) well past (>5 hours) dark. The farthest west I have worked on 10 meters has been a few Zone18 stations in USSR.. and the farthest east (in the AM) has been JA's. Since 10m usually depends so heavily on daylight to get the MUF up to 28Mhz, any path that travels across night-time parts of the earth is rare (and precious, I might add). I have worked a few stations both paths, but never during the same time of day on 10meters.. sometimes on lower frequncy bands.

Never heard that - but, on the end of one Iron Butterfly
album, circa 1967 or so, the sappy message "We Love You"
is sent in Morse code.

gleason@mwk.uucp

3062. My List of Mail Order Electronics Companies

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-24 18:54:53 UTC
From: jfw@ksr.com
Message-ID: <5600@ksr.com>
Source record: 293179
Cross-posted to: rec.radio.amateur.misc,sci.electronics

[$Revision: 2.2 $; last updated 24 September 1991]

Here is my list of companies which will sell electronic components in small quantities. Most of these places I have bought from, a couple I haven't. Being a ham radio operator, I am most interested in RF components, and in particular, air variable capacitors, which tend to be scarce (and tend to be used or surplus even if I've otherwise labelled the seller as "NEW"). I apologize in advance for disparaging remarks about what happens when parts suppliers start selling computers, but anyone who has watched Jameco over the years will know just what I mean (though their latest catalog hints at possibly returning to selling parts).

Categories are:
NEW COMPONENTS Distributors and sellers of new components, or "new and some used" in a couple of cases.
SURPLUS ELECTRONICS Usually overstocks, occasionally used equipment. Ideal for stocking the junkbox, usually have dependable stock lines of resistors, capacitors, and some semiconductors, but won't have those LCD modules forever... An invaluable resource, don't shy away from them.
SPECIALTY COMPONENTS In particular, crystals and toroidal cores.
KITS Ham radio kits, random electronic kits, whatever they have.
LITTLE GUYS Separated out because of some twisted sentimentality, I suppose. Intended to honor one or two ham spare-bedroom operations.
PUBLICATIONS Two publications which are essentially all want-ads, plus the address for SAMS PHOTOFACTS because everyone always asks about it on sci.electronics.

NEW COMPONENTS:

Ocean State Electronics
P.O. Box 1458
Westerly RI 02891
(800)-866-6626 (orders)
(401)-596-3080
(401)-596-3590 (FAX)
Minimum $5, S&H $4, free catalog. Wide array of RF parts, especially air variables and B&W coils, plus kits for most QST projects since 1976. "Non cataloged items gladly ordered." Fast shipping, unless (like me) you don't pay attention to their request that you CALL about air variables and they hold your order for a couple of weeks while they see if they can scrounge up one that they've just gone out of stock on...

Radiokit (store is located at:)
P.O.Box 973 169 Jeremy Hill Rd.
Pelham NH 03076 Pelham NH 03076
(603) 635-2235
No minimum ($3 service charge if under $20), many kits, lots of J. W. Miller chokes & coils, B&W coils, RF switches, Millen variable capacitors, lots of parts in general. Send $1 for the catalog.

Circuit Specialists Inc
P. O. Box 3047
Scottsdale AZ 85271-3047
(800) 528-1417
No minimum with check or money order, $15 otherwise. $3 S&H.
New electronics, good RF assortment, increasing infestation of computers.

Mouser Electronics Mouser Electronics Mouser Electronics
11433 Woodside Ave. 2401 Highway 287 North 12 Emery Ave.
Santee CA 92071 Mansfield TX 76063 Randolf NJ 07869
Mouser Electronics
370 Tomkins Court
Gilroy CA 95020
Catalog Subscriptions: (800) 992-9943 (Continental US only)
Sales & Service: (800) 34-MOUSER (800-346-6873) (US, Puerto R., Canada)
Very complete catalog of brand-new components (though no air variables). Usually quick service, $20 "minimum" ($5 charge under $20).

Digi-Key
701 Brooks Ave. South
P.O.Box 677
Thief River Falls, MN 56701-0677
1-800-DIGI-KEY
No minimum, $5 handling under $25, free and very complete catalog, very nice indeed. Prices aren't always the best, but rarely excessive. Weak on RF specialty parts (though they now have the ever-popular NE602N), but they do have blue LEDs.

Active Electronics
11 Cummings Park
Woburn MA 01801
(800)-677-8899 (US)
(800)-363-6592 (Canada)
$25 minimum, $5 S&H UPS, free catalog. They have 8 stores in the US (Santa Clara CA; Chicago IL; Baltimore MD; Woburn MA; Detroit MI; Mt. Laurel NJ; Long Island NY; Seattle WA) and 9 stores in Canada (Quebec City; Montreal (2); Ottawa; Mississuaga; Winnipeg; Calgary; Edmonton; Vancouver BC). Lots of stuff, oriented more toward supplying last-minute requirements of companies than hobbyists, but perfectly happy to take your money in small doses (stores have no minimum order or shipping&handling). Some items in their catalog are subject to a $25 per ITEM minimum, which is kind of a drag.

Newark Electronics
Send catalog requests to:

Newark Electronics
ATTENTION CATALOG DEPARTMENT
4801 N. Ravenswood Ave.
Chicago IL 60640-4496
(312) 784-5100
They don't have a single mail address or phone; instead, one is supposed to call the closest of three pages worth of branch offices. I don't feel like typing in the entire list (it's copyrighted, anyway :-), so send email for your "local" distributor, or call their administrative offices at the number above. They have a $25 minimum order; they are a Real Distributor, but accept small orders (over the minimum, of course). Their catalog currently 1248 pages; they are very complete (except, of course, for my favorite scarce item, the air-variable capacitor). Note that the catalog prices tend not to match reality all that often, so order by phone rather than by mail; prices tend to be higher than other places, but they have a lot of things that are hard to find from other outlets.

Arrow Electronics, Inc. Catalog requests to:
Catalog Division Catalog Division
1860 Smithtown Ave. 25 Hub Drive
Ronkonkoma NY 11779 Melville NY 11747-9828
(800) 93-ARROW
Minimum $25; catalog cover price is $25 but if you convince them you're with a company they'll probably send one free. They are a Real Distribitor, but also didn't mind my placing a personal order.

MCM Electronics
650 Congress Park Drive
Centerville OH 45459-4072
(800) 543-4330
Minimum $20 ($25 for charges, and they don't take personal checks), handling $1.95 + shipping. Oriented toward repair technicians, really heavy on VCR parts and somewhat overpriced doodads, lots of useful stuff not easily found elsewhere.

Fordham Radio Supply
260 Motor Parkway
Haupauge NH 11788-5134
(800)695-4848
Tools for technicians. One or two items are not outrageously overpriced.

Jameco
1355 Shoreway Road
Belmost CA 94002
(415) 592-8097
$30 minimum order (was $50), >$5 shipping & handling. Their most recent catalog may have reversed a long trend of abandoning parts in favor of PC compatibles, or it may not; one can always hope.

JDR Microdevices
2233 Branham Lane
San Jose CA 95124

Orders: 800-538-5000
Cust. Service: 800-538-5001
$10 minimum, $5+ shipping. Mostly computers now, but they haven't yet decided to abandon components.

Johnson Shop Products
P.O.Box 160113
Cupertino CA 95016
(408)257-8614 (408)996-3240
Catalog $1. No minimum. Shipping charge is based on UPS; very small orders that can be sensibly shipped in a first-class letter, include money for first-class postage. New and some used electronic parts.

DC Electronics
P. O. Box 3203
Scottsdale AZ 85271-3203
(800) 423-0070 (orders)
(602) 945-7736 (stock/price checks)
$15 minimum charge order, no minimum for checks, $3 min. shipping&handling. Wide array of ICs, good assortment of electronic components.

Dick Smith Electronics USA
P.O. Box 468
Greenwood, IN 46142
(317) 888-7265
The American branch of the Australian company. Some parts and kits, mostly new equipment of all stripes (audio, CB, and lots of ham equipment). Prices seemed high last time I checked.

EasyTech Inc
2917 Bayview Drive
Fremont CA 94538-9932
(800) 582-4044 (orders)
(415) 770-2345 (customer Service)
Apparently a brand new company, "dedicated to serving the Electronic Enthusiast/User." $10 minimum, UPS shipping is 5% of order (>= $3).

International Components Corporation
1803 NW Lincoln Way
Toledo OR 97391-1014
(800)325-0101 (US & Canada)
(503) 336-4400 (FAX)
Cabinets&Enclosures; Capacitors; Diodes; ICs; Potentiometers; Resistors; Sockets; Transistors; Books. No minimum order, $2 handling under $25.

SURPLUS ELECTRONICS:

All Electronics Corp.
P. O. Box 567
Van Nuys CA 91408-0567
(800) 826-5432
$10 minimum, $3.50 S&H. New and surplus electronics.

BCD Electro
P. O. Box 450207
Garland TX 75045-0207
(214) 343-1770
$1 for 1-year subscription to catalogs, no minimum, $0.95 for under $30,
$2.90 shipping. Surplus electronics, pretty random looking assortment.

Fair Radio Sales
P. O. Box 1105
1016 E Eureka St.
Lima OH 45802
(419) 227-6573
Surplus electronics. Heavy on parts for old Collins gear.

Hosfelt Electronics
2700 Sunset Blvd.
Steubenville OH 43952
(800) 524-6464
No minimum, $3.75 S&H. Surplus electronics.

Marlin P. Jones & Assoc.
P.O. Box 12685
Lake Park FL 33403-0685
(407) 848-8236
No minimum ($1 fee for under $10), shipping per UPS. Surplus electronics.

R&D Electronics
1224 Prospect Ave.
Cleveland OH 44115
orders: (800) 642-1123 (tues - fri 9am-4pm sat. 9am-3pm EST)
info: (216) 621-1121
$10 minimum. Surplus electronics.

Surplus Sales of Nebraska
1315 Jones Street
Omaha, Nebraska 68102
(402) 346-4750
New and surplus radio electronics. Wide selection: air variables. At
this writing (8 Mar 91), they are producing a new catalog (and, I gather,
out of old ones).

Tucker Surplus Store
1717 Reserve St.
Garland TX 75042
(800) 527-4642 extension 135
Surplus electronic gear; oscilloscopes and signal generators from the days
when dinosaurs with vacuum tubes roamed the earth (some solid state gear, but
all well used). Prices seem relatively high, and you'll be shocked to learn
how much it costs to ship a 75 pound oscilloscope by motor freight...

American Science and Surplus (formerly JerryCo)
601 Linden Place
Evanston IL 60202

(708) 475-8440
Surplus. *The* surplus place. Lots and lots of surplus. WWII gun cameras, velcro, laser disk chassis, 6 volt VW wipers motors, LEDs, rubber brains, you name it, they've had it. Catalogs are a really good time. $12.50 minimum order (which includes the $4 shipping charge).

SPECIALTY COMPONENTS:

JAN Crystals
2341 Crystal Drive
P.O. Box 06017
Fort Myers FL 33906-6017
(800) JAN-XTAL (Monday through Thursday)
They make crystals. Minimum order is $10, which might be one crystal, or might be two.

Crystek Corporation
2351/2371 Crystal Drive
P.O. Box 06135
Fort Myers FL 33906-6135
(800) 237-3061 (M-F)
They make crystals too. They were the cheapest last time I ordered, but I don't have an up-to-date price list. It took about 4 weeks, and they had said it would take 6.

ICM (International Crystal Manufacturing Co., Inc.)
701 W. Sheridan
PO Box 26330
Oklahoma City OK 73126-0330
(800) 426-9825
More crystals. They were more expensive, but they have lots of pre-made crystals for various rigs, so they would probably be faster.

Amidon Associates
12033 Otsego Street
N. Hollywood CA 91607
Toroid cores and related things. Very fast service.

K2AW's Silicon Alley
175 Friends Lane
Westbury NY 11590
516-334-7024
Free catalog, $10 minimum order. Semiconductors, in particular high-voltage diodes.

Small Parts, Inc.
6891 N.E. Third Avenue
P.O.Box 381966
Miami FL 33238-9980
(305)751-0856
$12 minimum. Mechanical parts, metal stock, Teflon(R) sheets.

KITS:
(The terse "Note:" descriptions are from the ARRL Kit List courteously supplied by Ed Hare and Mike Gruber at the ARRL.)

A&A Engineering
2521 W. LaPalma, Unit K
Anaheim CA 92801
(714) 952-2114
Kits, some components, some books. S&H $4.50, catalog is free with SASE (2 oz postage).

Antique Electronic Supply
6221 S. Maple Ave.
Tempe, AZ 85283
(602) 820-5411
Note: Broadcast receiver kits

Circuit Board Specialists
P. O. Box 951
Pueblo CO 81002
(303) 542-4525
As the name implies, they specialize in circuit boards; they have circuit boards for a variety of QST articles and ARRL Handbook construction articles. They also have partial kits for most of their boards. The catalog is free, but I had to request it a couple of times.

C.M. Howes Communications
Eydon, Daventry,
Northants NN11 6PT
England
Phone: +44 327 60178
Note: QRP, transmitters, receivers, misc.

Communications Concepts Inc.
121 Brown Street
Dayton, Ohio 45402
(513) 220-9677
Note: kits for Motorola Applications Notes

Dick Smith Electronics
P.O. Box 468
Greenwood, IN 46142
(317) 888-7265
Note: General kits

Down East Microwave
Box 2310, RR#1
Troy, ME 04987
(207) 948-3741
Note: Microwave preamps

Hamtronics, Inc.
65 Moul Road
Hilton, NY 14468-9535

(716) 392-9430
Note: Amateur, general interest

Lake Electronics
7 Middleton Close
Nuthall
Nottingham NG16 1BX
England
Note: Amateur

Mercury Systems
15 Lakeside Dr.
Marlton, NJ 08053
1-609-596-3304
Note: the ARRL Kit list didn't say what they carry; I don't (yet) know either.

Penntek Electronics
14 Peace Dr.
Lewistown, PA 17044
(717) 248-2507
Note: The Neophyte Receiver, QST

Ramsey Electronics
793 Canning Parkway
Victor NY 14564
(716) 924-4560
Amateur radio and hobby kits. The ham kits are all pretty simple and pretty inexpensive, and you get about what you pay for.

{See also RadioKit, Oak Hills Research}

LITTLE GUYS:

Oak Hills Research
20879 Madison St.
Big Rapids, MI 49307
Send $1 for a flyer. Some parts, QST article kits, transceiver kits, QRP stuff in general (they inherited the stock from Small Parts Center when they closed).

KA7QJY Components
Box 7970
Jackson WY 83001
(307)739-1634 evenings
Send a business-size SASE for a current list of parts. RF parts, including vernier drives and air variables. $2.75 shipping, no minimum. My last order took two weeks from when I mailed it and included a note apologizing for the delay!

R&R Associates
3106 Glendon Avenue
Los Angeles, CA 90034

(213) 474-1315 (res)
[Richard Rathburn, KB6NQ] "I mainly sell pc boards from QST, Radio Electronics, etc., and a few of in-house design. I also sell IC's, etc." Send a SASE every now and then for his most recent flyer. He also has boards for some Motorola Application Notes.

MANUALS:
Eico Electronic Instruments Co., Inc.
363 Merrick Rd
Lynbrook NY 11563
Note: No current kits, EICO manuals and schematics only

>feedback they used, I believe the output impedance was rather high.

Based on a couple EMAIL replies I received, I guess I should have pointed
out that, yes I know tube amps use transformers to lower the output
impedance. Let's take a push-pull 6L6 amplifier as an example.
According to my 1977 ARRL Handbook, with a 350 volt supply, the
tubes want to see a 4.2 k ohm load impedance. With an 8 ohm speaker,
this is 23-to-1 turns ratio. Yet the tube plate impedance is 33K
which will reflect to 63 ohms at the speaker. Assuming the output
amplifier uses 20 dB of negative feedback, the amplifier output impedance
will be 6.3 ohms.

Now audiophiles these days make a big thing of speaker "damping factor"
which requires low output impedance from the amplifier. So my
previous question still stands:

>Did they design speakers differently in the old days? Will modern
>speakers designed for low driving impedance work properly with tube-type
>amplifiers? Will speakers designed in the tube days work properly
>with modern solid-state amplifiers? IMWTK

>Typically they ranged from 2500 to 4000 ohms.

There's a difference between the recommended load impedance (in the
2500-4000 ohm range) and the tube plate impedance (many times higher).

3069. Need assistance in pricing used HT equipment

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-24 20:25:00 UTC
From: JPB7946%TNTECH.BITNET@cunyvm.cuny.edu
Message-ID: <01GAYQU9DIW0DRP8OP@TNTECH.BITNET>
Source record: 293184

I am interested in moving up to a new handheld, but in order to finance this move, I need to sell my current HT. Not being familiar with current used equipment market prices, I am seeking advice on a fair selling price for my current HT setup. This rig has served me well for the past 18 months, but being a gadget freak, I want to move up to something with more "whistles and bells." The set would make a great starter kit for a new ham. All equipment is in EXCELLENT condition, and has only been used at my apartment and in the car (and alot of the time spent sitting in my shack desk drawer!).

Equipment Listing

Icom IC-2AT 2m HT ("the brick") all original manuals, including schematic
Icom HM-46 Mini-Speaker Mic light weight, easy to use
Icom DC-1 DC Converter for use with CP-1, or 12V power supply
Icom CP-1 Cigarette Charger use to charge battery, or power radio while using DC-1

I would prefer to sell all of the equipment as a package. If you are familiar with this equipment, PLEASE let me know what I should ask for this.

Thank you for any help that you can offer.

73,
Jon / N4VRN
JPB7946@TNTECH.BITNET

3070. Re: ICOM Scanners

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-24 20:49:25 UTC
From: rja@batcomfs.Eng.Sun.COM
Message-ID: <20428@exodus.Eng.Sun.COM>
Source record: 293199

A couple of corrections:

In article <19667@ncratl.AtlantaGA.NCR.COM> gedwards@ncratl.AtlantaGA.NCR.COM (Gordon Edwards) writes:
+
+ ICOM R1
+
+After many weeks of playing around with my newest toy, the
+ICOM R1, I've decided to give it a review that will help others
+who are interested in purchasing this radio.
+
+The radio arrived in a box containing the basic radio, a VHF/UHF
+wideband antenna, belt clip (which you have to screw on yourself),
+earphone, battery charger and instruction manual.
+The first thing you must do is put the radio on charge and let
+it sit there for approximately 15 hours (as this is what the
+manual suggest to get a full charge). During this charging

I bought mine from Scanners Unlimited locally. What I was told,
and what I did, was to plug in the wall charger and the receiver,
and wait about 10 minutes. Then I used the scanner running off
AC power. That night I left it charging and in the morning it
was fully charged. The battery which comes with the receiver
seems to be good for a couple of hours under continuous use.

+Once you have fully charged the internal batteries (which are
+virtually nonaccessable) you are ready to start operation this

Not being an experienced scanner user, I must be missing something.
The builtin batterys are accessible by removing the bottom plate
which slides off. True, you cannot easily remove the batteries,
but do you need to? Certainly not to add an accessory battery
pack with more amp hours, nor to charge it. My mode of use, once
I get additional batterys, will be to put on a large 10 hour use
battery pack for normal use, and to keep the internal 2 hour pack
fully charged for emergency use. When an external pack is on the
internal batteries will not be used.

+scanner. There are three separate knobs on the top. The
+power/on/off is in the center and the squelch is on the left.
+The location of the squelch knob and the positioning of the
+BNC connector for the antenna are so close together it makes
+it difficult for anyone with large hands to operate this knob.

Yup. Even with small hands you end up thumbing the side of the
buttons to adjust them.

+You turn on the radio and it will come up on Memory channel
+number 0 (yes, channel zero). The radio goes from 0-99. Now
+comes the hard part. In order for you to program a frequency,
+you must first move it to the "clear" format before you can
+enter it. This is accomplished by depressing the Function key
+on the left side of the radio while pushing the "CL" key simultaneously.
+Once in the clear mode, you enter your frequency, what mode
+you want (am, fm or wfm) and then ENTER.
+Now you must again depress the function key and then the "mr"
+key to get it to accept it. After awhile, you will get use to
+this procedure, if not, you will have a whole lot of blank
+channels to choose from.

I admit the procedure is poor, but it's not that bad. You
must preselect the memory channel to program, which is a two
button, two handed, operation. then you thumb-punch the clear
button to get into VFO mode, then you enter the freq (via ENTER),
then you do another two hand/two button F-MR to copy the freq to
the pre-selected memory channel. This is slightly different than
what is written above. At any time you can get to VFO mode by
simply pressing the clear button once, or twice if scanning.

To program a freq to memory, you must start in memory mode, go
to VFO mode, enter the freq, then copy it to memory mode. This
must be done for each memory channel you want to program, but
the internal battery will keep memory safe even when your internal
power battery runs low, so you don't have to do it often.

+
+To get the scanner to scan is another MIT graduate procedure.
+This radio does NOT have "banks" to it. You have to select
+what channel span you wish to scan. This means if you want to
+scan channels 0 thru 15, you have to go into a setup mode and
+enter the upper and lower channel limits. YOU CANNOT SCAN DIFFERENT
+LIMITS OF CHANNELS SUCH AS 0-15, 25-30 AND 90-99.

True. However you can skip programmed channels. This
is a poor substitute however, and programming the skips
is not a task you'll want to do too often.

+
+Performance:
+
+The R1 starts at 100 kHz and goes all the way to 1300 mHz. It
+will only receive signals in AM, FM or NFM. There is no CW or
+Side Band selectivity. If you wish to monitor any signal below
+30 mHz, you must use an antenna other than the one supplied.
+I actually work within 1 mile of the WSB-AM 750 transmitter and
+when I tune in their frequency, I can barely hear it. The
+supplied antenna does, though, work rather well on 30-500 mHz.
+Performance decreases severely on anything over 500 mHz.

Sadly, AM operation seems highly dependant on antenna orientation,
and whether your skin is contacting the receiver.
+
+The internal batteries are good for about 5-6 hours of monitoring,
+3-4 if continuous carrier.

I've been told 2 hours of active use, and I seem to get 2-3.
+
+
+Necessary Accessories:
+
A cigarette lighter power adapter is also offered, and I think
one would be useful.

+Would I buy this radio again if I had to do it all over again?
+I really don't know. As I said earlier, I have never had the
+opportunity to compare it with the AR1000, but would like to.
+This radio is not for the weak at heart. There are many good
+points to it as is an equal amount of bad. Be prepared to
+study the manual inside and out as well as many hours of
+frustration trying to figure it out. ICOM could have done a
+better job of this radio, and who know, maybe they will introduce
+a R2 one day that is better.

I know someone who has the AR1000, and they seemed to think the
R1 was significantly better both in workmanship and usefullness.
I cannot comment directly however.

> What was happening here? Was there some sort of backscatter occuring?
> This, however, wouldn't account for an appreciable time delay.
> Long path sounds sort of farfetched. Any ideas would be appreciated.

What's missing here is a rough estimate of just how long the delay was.
If it is long enough, then we could begin to consider the most interesting
of the possibilities, the rare and not-so-well understood phenomenon of
long delayed echoes, generally attributed to naturally occuring ducts which
extend out into the far reaches of the magnetosphere and are capable of delays
which defy explanation by porpagation confined to the earth-ionosphere system.

Occurences have been documented in both the ham radio and professional
literature. I could probably provivde references but am at a handicap at
the moment, still unboxing things from a recent move. A friend has made
a collection of LDE articles. I'll see if I can get references from him and
post.

]> |>Also, keep in mind that the radiation within the ham bands can still cause
]> |>trouble. It may mix with other sources on the aircraft or on the ground
]> |>and end up on a sensitive frequency.
]
] I suppose that only ham frequencies are subject to this phenomena?
Does anyone else TRANSMIT within an aircraft?

Dismissing a first hand report, you say:
]I talked with some design engineers of aircraft nav equipment over the last
]couple days. I reported to them the claims made by folks on the this net.
]It seems their chief concern was front end overload most commonly caused
]by ground based FM broadcast stations. All said that interference with the
]nav IF's would take significant amounts of RF power at the IF frequency.
](Field strengths in excess of 70 db over 2uv).

I have also transmitted from aircraft with a 2meter HT and observed
the com/nav equipment cease to work during the transmission. I had
permission - I was the pilot :-) I don't care WHAT the design engineers
say, I have observed it. I also know enough RF engineering to know that
a 2 meter radio can very easily interfere with VHF NAV/COM equipment. Ever
heard of the broadband noise generated by ALL transistor amplifiers?

] I have over 2,000,000 miles of commercial airline travel
]logged over the years since 1963. During that time I operated aeronautical
]mobile once after obtaining the permission of the pilot. I operated a 2M
]handheld from the flight deck at 35,000 ft. while flying under VFR.
](this was around 1978 on a flight from Pittsburg PA. to St Louis)
]I have operated aeronautical mobile from a variety of private aircraft and
]once from a military aircraft (F18). In every instance while flying VFR.

I have also operated aeronautical mobile from a bunch of aircraft, including
many hours in a military aircraft. I was ordered to cease operations on
the P-3 because the radio interfering with the navigational equipment.

]The Federal Aviation Regulations are fact. Obey them. Other coutries have
]different rules... be aware of them and obey them when you are in their
]jurisdiction.
You betcha.
]I remove all power sources from my radios before boarding commercial
]aircraft. (except lithium memory backup of course) I do not use the
]radios during the flight, even for reception.
I don't remove all power sources. I also don't turn on the radios.

3073. Radio Modem

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-24 23:02:15 UTC
From: rudolf@sirius.UVic.CA
Message-ID: <1991Sep24.230215.14916@sol.UVic.CA>
Source record: 293187

Not being a frequent visitor to this group, I may be requesting information readily available elsewhere, but here goes anyway:

I am loking for a 9600 bps radio modem, preferably as a kit or open package that I can play with - I'm looking at varrious modulation techniques.

In the 8/91 RFDesign, Dataradio Corp. was shown to have a T-Modem 96. Has anyone experienced this modem? Does anyone have an address or phone number for Dataradio?

Any info would be most welcome, but please use direct e-mail if possible. Thanks very much in advance.

Rudi

3074. TS-820S Keying

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-25 00:00:07 UTC
From: slondon@isis.cs.du.edu
Message-ID: <1991Sep25.000007.16812@mnemosyne.cs.du.edu>
Source record: 293189

The Kenwood TS-820S uses negative voltage keying.

In the old days, this was known as "grid-block keying". A relatively
voltage (-100 volts) was applied to the grid of the driver stage
(and possibly the power amplifier stage) to "block" the amplification
in those stages.

Make sure that the keying transistor that you are using can handle
100 volts between the collector and the emmiter. It's very low
current, so don't worry about electrocution !

PRODUCT REPORT:

Realistic TRC-500
Voice Activated
FM Transceiver
(Face it R.S., walkie-talkies)

On sale at my (and maybe your) local Radio Shack thru Sept 28
Sale Price $39.95, usually 69.95

```
**************************************************************************
* Disclaimer #1: I do not work for or represent Radio Shack in any *
* way, shape, or form. Nor would I ever want to. *
**************************************************************************
* Disclaimer #2: I never buy anything at Radio Shack, unless it's on *
* sale, REALLY cool, or I'm desperate. In this case, #1 and (IMHO) *
* #2 apply. *
**************************************************************************
```

SYNOPSIS: The transceivers were mounted in motorcycle helmets and used successfully by driver and passenger on a 400+ mile trip. Caveats for intended use are included.

REPORT:
My motivation for trying these walkie-talkies was to get an easy-to-use intercom for an impromtu weekend trip. I called around the local motorcycle shops, and discovered the least expensive intercom was about $65 bucks with tax. Not an inconsequential amount, especially since I had just popped for two full-face helmets. It was hard enough to talk on the bike with open-face helmets, so I surmised that some kind of intercom was needed.

So I also noticed that Radio Shack had these 49 MHz voice activated (VOX) walkie-talkies on sale at $39.95, usually $69.95. So I went down to the store to check'em out. As typical, the salesperson didn't know quite what a transceiver was, but "walkie-talkies" worked. Next, install those worthless red batteries (9V), then teach the salesperson how to use them!! The walkie-talkies seemed to do their thing ok, had some decent volume, and, they are VOX!! COOL! (for a relative neophyte). So I bought'em on the chance that they'll work on the bike, and I'd have a toy if they don't.

PARTS AND CONTROLS:
Each walkie-talkie has a one-sided foam-padded earphone, telescoping headband, and a mike on a flexible boom. A 3 foot cable attaches the

earphone to the transceiver. The transceiver has an accessory clip (included) that works well, and is removable. The controls are not too confusing: 3 tri-position slider switches, and one pushbutton, as follows:
POWER OFF/MAN(ual)/VOX
VOLUME (earphone) L(ow)/M(edium)/H(igh)
VOL/MIC (microphone) L(ow)/M(edium)/H(igh)
PUSH TO TALK (PTT)

MODES OF OPERATION:
All communication is simplex, that is, only one person can talk at a time. In MAN(ual) mode, just push the red PTT button to talk. But don't interrupt! You can't hear the other person if you push the PTT. In VOX mode, the same thing happens. So you have to ask for the last transmission if you sneeze or burp or smack your gum.

HELMET MOUNTING:
The headband and earphone weren't going to fit in our helmets, so I did a little modifying.

Removed the foam from earpiece
Unscrewed the earpiece halves, breaking the glue seal
Removed the mike boom and headband from earpiece shell
Unscrewed antenna holddown, removed antenna from shell
Unsoldered mike (2) wires
Unsoldered antenna coil (1) wire
Unsoldered earphone (2+1) wires
Pulled all wires out of shell, after removing strain reliefs
Resoldered all parts
Substituted stranded copper wire for antenna, solder connection

Then, I just had the working guts. In my helmet, a removable foam piece takes up room by each ear, so that's where the earphone lives, on the right side. It could go the other way, as my passenger's does. I pushed a small hole through the neck cuff for the mike and boom to extend through, towards my mouth. The now flexible antenna was slipped behind the headliner. The fit is a little tight when putting on the helmet, but wearing it is comfortable. The other helmet didn't have the removable foam, but has room for the earphone. To hold it in, I cut a 35mm film canister to 3/8" height, pushed it onto the back of the earphone (it just fits), epoxied a little velcro to the canister and stick-taped velcro to the helmet liner. So the thing stays in by velcro.

USING THEM ON THE ROAD:
This system increased our enjoyment of the trip immensely!! We could talk to each other without yelling, or straining too much to hear. Much better than without. The best $40 you can spend if you want to enjoy the trip WITH someone.

My bike is a '81 Honda CB900 Custom, equipped with fairing, trunk, and hardbags. Not a big noisemaker, but not exactly quiet either.

Off the bike, the H(igh) VOX/MIC setting (high sensitivity) works fine. In full-face helmets, we can hold a fairly private conversation without being overheard. (Kinda reminds one of Maxwell Smart's Cone of Silence, though!!) In town, on the bike, the H(igh) or or M(edium) setting worked for me, if my revs are low. Once speed is greater than ~30 mph, I found the need for L(ow) VOX/MIC.

My passenger is exposed to more wind noise, and found she could not use VOX at highway speeds. She tended to clip the thing to my jacket collar, so she could get to the switch easily. We experimented a little with putting extra foam over the end of the mike, which helped me in using the VOX. But she still has to use PTT.

Listening volume was fine. I set my unit on L(ow) on the highway, except when my friend was tired and talked too softly. She used M(edium) to listen to me. Helmets are decent medium frequency filters, and the earphones were pressed right to our ears.

Hand signals we required to interrupt the other person, due to simplex operation as previously described.

We got outside interference when passing through some urban neighborhoods, 3 times suring the trip. It usually lasted for 1/4 mile.

CAVEATS:
We fell easily into waiting for the other to complete a sentence. If you like to interrupt, YOU CAN'T!! (This may be an advantage to someone! ;')) We would have to ask each other to repeat a sentence or a thought sometimes, but the alternative of yelling is a drag.

Range: The units did not perform to the advertised 1/4 mile range, probably due to the alteration of the antenna, more than anything else. My informal test gave us a range of 200-300 feet. This was not a problem, as we were always within 10 feet of each other when we needed to use the units, usually more like 2 feet. READ THIS CAREFULLY!> For this reason, I cannot recommend them for bike-to-bike communications. However, I cannot recommend AGAINST them for that purpose, either. I didn't try them that way! If I wanted to use them for bike-to-bike, I would have figured out a way to mount the antennas vertically, and I would have retuned them. <READ THIS CAREFULLY! If you try them that way, let us know what happens!!

SUMMARY:
I highly recommend Realistic's TRC-500 Voice Activated FM Transceiver, 49 MHz, for the purpose stated above. This system greatly increased our ability to communicate in a fairly noisy environment, for small numbers of $$$. I probably wouldn;t have bought them at $69.95 (regular price).

On sale at my (and maybe your) local Radio Shack thru Sept 28

The new Alinco DJ-160 Radio will receive between 137-174 Mhz, and
transmit in the 2Meter band only (144-148Mhz). A simple modification
to the radio will enable it to transmit in the full range it
receives currently. I have not tested the output power on other
frequencies (Due to my one and only watt meter getting fried)
however I have tried setting a weather receiver a small distance
away, and I did hear the radio in the receiver. To make the mod,
the following must be done: (I assume that you have some experience
with electronics and that you can tell a wire from a resistor, from a
transistor)

1) Take the battery of the radio by lifting the battery release
button. If you look at the bottom of the radio, there will be
a metal plate that is held on with 4 small screws. Take this plate
off, noting exactly how the clip was held on (like the slot for the
battery release clip)

2) On the back of the radio there are two screws that hold the back
of the radio on, take these screws out.

3) Now you should be able to lift the bottom part of the radio by
the battery release button slightly apart. I was told that you
should take the top knobs off, but I found that I didn't have to.

4) If you take the Battery Release Button and turn it about 90
degress, the button should come out easily. After you get the
small piece of plastic that is the button, you should see a yellow
wire behind where the clip was.

5) Take a small wire cutter and CUT this YELLOW wire. You should
probably make sure that the wire doesn't have bare metal showing
from a lousy cutter, because I don't think that grounding this wire
to the case would be HEALTHY for your radio. :-)

6) After You cut this wire. Assemble the radio, and just before you
turn on the radio, do a power reset by holding the FUNC button while
turning on the radio. This will reset the radio to ALL of the
factory set parameters. YOU WILL LOOSE PROGRAMMED FREQUENCIES that
were programmed into the memory mode of the radio, so just write the
frequencies down before proceding with the above instructions.

7) The radio should be just like new, except that the transmit will
be enabled for ALL frequencies! GOOD Luck!

If you use these mods for ILLEGAL purposes, pity upon thy sole,
for you do not belong in the ranks of Amateur Radio. This
information is only supplied for Legal and Informational Purposes
only and I can NOT be held responsible for anything that you do with
this INFO. And if you are an idiot and screw up your radio by your own
stupididy, TOO BAD. I can't be held responsible for my own actions
anyhow, so as Brian@ucsd.edu would say, "So There!"

I realize this No-Code issue has been dragged out beyond belief, which is one of the reasons I dropped the amateur groups, however, I have 2 simple questions:

1) If I get the no-code Technician, I am allowed 144 MHz operation, correct? (What exactly CAN I do?)

2) How can I find the location and time of the next test in my area? (Philadelphia, PA)

Please reply via email..

Thanks very much.

Have to agree on that one. Comparing a Ringo Ranger II (which is
slightly better than the Ringo) with a Hustler G6, there was no
comparison. Usually 2 S units difference both on Tx and Rx on the G6,
with both antennas mounted on identical structures (40' tiltover towers).
Don't even consider a Ringo Ranger II in a windy environment. The
one used in the above comparison was only up for a little over a year
before it had a real nice bow in it due to winds.

>I really like the Comet and would recomend it to anyone who doesn't
>live in hurricane prone areas. For those poor souls, the heavier Diamond
>X700 *might* be a better choice.

Small correction. The X700 is _longer_ than the X500. The heavy-duty
version of the X500 is the X500HNA. It has a slightly thicker
fiberglass radome and a beefier base support. Both the X500 and the
X700 are rated at 90 MPH, but considering how much even the X500 flexes
in the wind, I'd imagine the X700 would have a _lot_ of sway. The X500HNA
is rated at "90+ MPH". Personally, I think the Hustlers are more
rugged than their Diamond counterparts, but haven't had any problems
with a Diamond X200 at 110 feet nor a Hustler G6 at 60' (Hustler in
a _very_ windy environ at the top of a mountain).

The Finnish telecom authorities just announced a new regulation for the low
power private FM broadcasters. It is forbidden from now on to transmit non-
modulated carrier outside the program hours.

The main reason for the regulation is said to be 'interference to the aero-
nautical navigation systems'. In my opinion this has something to do with
the detection of erroneous readings that was discussed in this group earlier.

3086. Cordless "Headset" Telephone Wanted!

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-25 12:29:56 UTC
From: root@mjbtn.JOBSOFT.COM
Message-ID: <10591@mjbtn.JOBSOFT.COM>
Source record: 293205
Cross-posted to: misc.wanted,sci.electronics,rec.radio.amateur.misc

Hello, (I apologize for the odd cross posting - not sure where info lies)

A while back, a friend of mine showed me a neat little cordless phone that was unique in that it had a headset much like the one you see operators taking orders for _Time_ on those TV commercials (although not as fancy). It was by a company called Plantronics. I had seen several sources for that model in DAK and Service Merchandise, but by the time I got to them, they had quit carrying the unit. Also, there are surely other companies that make a cordless phone that has a headset. This Plantronics was complete in that it the headset attached the radio part with the connecting cable serving as the antenna. The radio part could hangup, answer, and dial. There was a base station for the phone link and charging.

If anyone has any info on companies that manufacture a device like this and could provide names, cities, phone numbers, and even pricing (if possible), I would be forever grateful. Please email as this group is not a regular here at my office.

Thanks in advance!

Mark.

3087. Heath GC-1000 Most Accurate Clock Modifications

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-25 12:52:32 UTC
From: gibbonsj@iccgcc.decnet.ab.com
Message-ID: <1991Sep25.075232.5826@iccgcc.decnet.ab.com>
Source record: 293206
Cross-posted to: sci.electronics,rec.radio.amateur.misc

Below is a summary of the modifications I have done to the Heathkit GC-1000 Most Accurate Clock to improve its performance:

1.) I replaced all of the IC sockets with machine tool pin sockets. Having to re-seat some of the IC's every now and then is unacceptable. I can't believe that HEATH used such CHEAP IC sockets! (Well, maybe I can...)

2.) Re-designed the clock drive to the microprocessors. The 470pF AC coupled 3.600Mhz clock drive relied on the fact that the input to the F8 uP's had a diode input clamp (probably the substrate of the uP) and the input voltage would swing from -0.6V to +3.5V. I replaced the cap with a 74HC14 CMOS driver with am 82 Ohm series resistor (to match the impedance of the driver to that of the PC board to reduce ringing). The voltage now swings from ~ 0.2V to ~ 4.8V. Risetime of the clock remained about the same.

3.) I also replaced the output transistor push-pull circuit that drives the external 3.6000 Mhz output reference with a 74HC14 driver. I actually tied 3 of the inverter gates on the same chip in parallel (prop delays are almost identical, so you can usually get away with this) to drive this output. Created a nicer looking waveform. This was the other half of the chip used for the clock driver section (I used 1 gate of the other half for the CPU clock driver, 2 gates remain unused (and tied off)).

4.) I added a second +5V regulator (78L05) and separated the D/A Latch, R/2R resistor ladder and all associated circuitry that runs the Colpits Oscillator / Varactor Diode / Clock Driver circuitry. One cut on the top side of the PCB by the input inductor (and the feed-thru hole) isolated the clock section +5V very nicely. The problem I noticed is that when you turn on the displays, the main +5V regulator would droop about 100mv causing the D/A voltage to the varactor diode to droop. This was enough to shift the 3.6000 Mhz frequency by ~ 15-20 Hz. Still within the spec of the clock for output freq accuracy, but by adding this second regulator the frequency now shifts less than 0.1 Hz (thats the resolution that my freq counter can measure to). I also bypassed the clock section with a few 10uF Tantalum caps to reduce switching noise.

5.) Eliminated the display ghosting (display shut off but the 5/10/10MHZ indicators still glow a little). This was accomplished by simply grounding the unused side of the display enable switch (labeled 3 + 6 on the schematic). You also need to cut the power to the decoder IC U101 (pins 1 and 16) and take these two pins directly to the power connector pins 1+2 (+5) on the display board (before the switch). If you don't, when you shut the display off IC U101 will load down the uP lines to it and the D/A latch will always get loaded with 00H, thus screwing up the ability of the clock to tweek its own oscillator frequency.

6.) Replace all of the caps associated with the 100Hz and 1Khz tone decoder circuits with polypropolene or stacked foil caps. This reduced the clocks sensitivity to temperature drift (and thus lousy performance) during times when the display is on and the insides of the clock heat up. I also replaced the 2 - 5K Ohm open face pots with 20 turn adjustable pots - much easier to adjust accurately. The 2 phase-locked loop adjustments are made much easier by just tying a high-impedance probe on pin 5 of the 567 PLL chip and adjusting the frequency to either 100.0 Hz or 1000.0 hz. Much easier to adjust than Heath's method. (In talking to the techs at Heath, they recommend this method over that in the manual). Caps and everything were ordered from Digikey for about $10 total.

7.) I added a MOV and a .001uF 1KV cap on the AC input to help line noise rejection and spike suppression. I personally run the clock off of a 12V 8AH GEL-CEL (I had sitting around for a while, figured I better use it or loose it) and then use a float-voltage charger for the battery (not a cycle-voltage charger). I also added a 0.1 uF ceramic disc cap on the output of the transformer (input to the full-wave bridge) for added noise suppression.

8.) The transformer that HEATH supplies in the GC-1000 is just as bad as the Radio-Shack transformers: They skimp on the wire size AND the # of turns on the primary thus giving LOUSY line regulation and they run HOT! DUMB! DUMB! DUMB! I only plug my unit in when I move it (in case the 12VDC connector unplugs and wipes out the previous months of clock oscillator tweeking). If you use the transformer, replace it with a real one that can handle the 800ma load without sagging so badly (and getting so blasted HOT!).

9.) I also added a computer interface to directly look at the 5-10-15 Mhz band indication, HI-Spec LED and the 100Hz and 1Khz tone decoder outputs. (The interface is nothing more than a 74HC14 inverter tied to the appropriate lines on the F8 uP). I have a CMOS Z80 system monitoring these lines and when the clock goes into or out of Hi-Spec, I kick the clock's serial interface and store the time and band info in an EEPROM. I'm still writing the code, but have the basic system working now (capturing data). It will basically give me information on when the bands are 'open' to Ft Collins, CO. (which is 1240 miles west of me).

I plan on using the 100Hz and 1Khz data for a later project - To be able to decode the WWV data stream myself (probably using a 68HC11 uP) and create a real serial interface that tells you what time it IS, not what time it WAS 1-2 seconds ago (the HEATH serial 'bit banger' interface STINKS!)

I'm still debating on whether to attack the receiver section of the clock - It works ok, but it COULD be a WHOLE lot better... hmmmmm..... anyone else tweeked the receiver yet???

[It's a fun little project that keeps me out of trouble....]

Heath HW9 kit/partial kit wanted

I am most interested in locating either an unassembled or
partially assembled Heath HW9 kit. There doesn't seem to be
anything out on the market that comes anywhere close to the
Heath QRP kit.

Thanks

>Besides, the balast is nothing more than a hot wire resistor anyhow.

[remainder deleted]

Actually, no--at least not in a quality receiver like the R-390A. Ballast tubes are there to *regulate* current, not just limit it (as does a resistor). The resistive element in a ballast tube is actually termed a *barretter*--a wire of a specific metal or alloy enclosed in a specific atmosphere. (Some barretters are iron wires in a hydrogen atmosphere, for instance.) Its temperature coefficient is such that it acts to keep current through it constant.

Regulating the heater or filament current of a tube used in a vacuum-tube oscillator is well worth doing if you want maximum frequency stability, especially where line-voltage variation is prevalent. Every vacuum-tube based receiver I've heated the tubes of with regulated dc instead of ac stepped down from the line was *audibly* more stable than the unregulated-ac-heated case. Test: Listen *closely* to a CW signal tuned in a couple of hundred hertz when (and for several tens of seconds after) a load on the same 120-V side of your house wiring--say, a refrigerator--kicks on. Heater/filament related frequency shifts may take a few seconds to occur because of the heater/filament's thermal inertia.

>Does anyone know of any MODS that are available for ICOM's IC-2SAT?

My wife and I got a pair and have been pretty happy with them. Simplex range is pretty limited, but that's life (and that's what repeaters and external/mobile antennas are for!)

They come with Extended Recieve enabled now, and Out-Of-Band Transmit is mostly done (you need to add a diode). Really incredibly tiny SMDs in there, so make sure you are a guru before you start hacking. I tried the simplest possible 2600-Hz tone-burst mod, but it's not compatable with Extended Tx...

>Are there any ICOM options that should be avoided?????

We still aren't too happy with the ICOM VOX mike, the gain is too low, the sensitivity is too high, and it doesn't _sound_ very good, but it's so convenient to use while driving that I'm going to try to hack it a bit to work better. We got the Touch-Tone decoder modules (for paging and coded-squelch operation), but we don't really use them (most repeaters eat touch-tones). CTCSS might have been useful, but we don't really miss it.

We've been pretty happy with our speaker/mikes, desktop charger, and BP-82 battery packs. All in all I'd do it again, though the 1200 MHz band is aufully tempting.

I remember an article in Audio Amateur Mag about building an amp with
four 811A's and direct drive to an electrostatic speaker (Hi-Z).

Seems to me there was also one with a bunch of output tubes running
in parallel as a cathode follower and driving a low-Z speaker.

And some really old radios used to not have permanent magnet speakers,
but ran the B+ through a choke that just happened to be part of the
speaker assembly - at least I think that's what it was when I took one
apart and tried to figure out what was going on - (from many many moons
ago).

3093. More on Weird Propagation Modes.

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-25 15:30:28 UTC
From: taormina@asl.SINet.SLB.COM
Message-ID: <9109251530.AA08379@sjosu1.sinet.slb.com>
Source record: 293216

First of all, LDE (Long Delayed Echo) really does happen. It's happened
to me twice in 32 years, both times on 20 meters. It requires an ideal
combination of reflective and refractive propagation to allow you to
hear yourself coming around the world. The delay is less than 1/4 second,
but it is possible to hear your own call on CW.
For me, exploring weird propagation modes is great fun. 10 Meters is an
ideal band because you have the benefits of Sporadic "E", "F" Skip,
sky wave, scatter, trans-equitorial scatter and all of the combinations
of those modes. It is also not terribly prohibitive to erect several
antennas for 10 meters to take advantage of different heights and patterns.
All that is required to experiment is to continually turn your antenna,
stop to stop. Don't be a victim of the straight-path beam heading chart.
The closer you are to the equator, the more skew-path propagation
you will experience. Never assume the band is dead. CQ regularly. Turn the
antenna 15 degrees and do it again. Erect several antennas and experiment with
times of day and sunspot activity. No one antenna is ideal, especially
for 10 meters. Compare notes with others. It won't be long until you
can recognize Sporadic E versus F
2 or tropo scatter versus meteor scatter.
If you live in the northern exposure, Aurora can play an interesting role
on 10 meters. Also, don't be a victim of WWV propagation bulletins. The
biggest bang is working something that you shouldn't be able to work!

>

[well-written report deleted]

If half-duplex between driver and passenger gets you down, note that you have to buy TWO of the RS units, so the effective sale price is $80, not $40. I don't know what the Maxon and Nady units are going for these days (I bought my Maxons in 1987 for $85 each), but if you are going to use it primarily for driver/passenger communication, you only have to buy one Maxon or Nady unit, and you don't have to observe half-duplex protocol. That's because in driver/passenger mode, both mics are connected in parallel, and both earphones too, so you can interrupt all you want.

If you want to talk bike-to-bike, you have to buy two, of course. The range on the Maxons is wimpy (less than 1/4 mile) but, I think, a little better than the RS walkies. Sometime I'll try to increase the final amplifier power. I'll have to increase the available power supply to the transistor (assuming it was intentionally cut down before), and increase the signal drive. Any radio techs out there want to lend a hand?

The controls on the Maxon and Nady are similar to the RS controls: OFF/PTT/VOX, MIC:LOW/MED/HIGH, EAR:LOW/MED/HIGH, and a PTT button. In addition, the Maxon has an INTERCOM/TRANSCEIVER switch to change between driver/passenger and bike/bike. In bike/bike mode, the passenger can hear but not talk. I'm sure the Nady is similar.

Since I wasn't interested, I don't know much about the models that come with music.

If you are sure you don't need bike/bike, two Nady models (PRC-2 and PRC-3) are driver/passenger only. I didn't price them, but I'm sure one of them is cheaper than two RS units on sale. The difference between PRC-2 and -3 is that the -3 has music (am/fm). The driver/passenger + bike/bike models are PRC-7 and -8; the -8 has music.

The Maxon model I have is either HI-49 or 49-HI (I never remember which).
It has bike/bike and driver/passenger but no music.

Anybody know of any other brands? Come on out of the woodwork, ok?

"Pilot to co-pilot, do you read, over..."

/\

MIDDLE LATITUDE AURORAL ACTIVITY WATCH

ISSUED: 17:10 UT, 25 SEPTEMBER

/\

MODERATE RISK PERIOD: 26 - 30 September (UT days)

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: LOW - MODERATE

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: >54 North Latitude

POTENTIAL LUNAR INTERFERENCE: MODERATE - HIGH

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: FAIR

A well placed solar coronal hole is beginning to enhance geomagnetic and auroral activity. Auroral activity is expected to become at least moderate over the high and northerly middle latitude regions. There is a chance for middle latitude observations of auroral activity, particularly prior to moonrise. Lunar interference will be moderate to high during this disturbed period. The ability to observe aurorae after moonrise will therefore be limited mostly to the higher latitudes.

3096. Butterfly summary; more advice needed

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-25 18:21:52 UTC
From: jmccombi@bbn.com
Message-ID: <66514@bbn.BBN.COM>
Source record: 293211

My thanks to the many folks who answered my request for recommendations on the Butternut Butterfly beam. This message is a summary of those responses, and another request for advice. The consensus:

Yes, the Butterfly works. It does radiate, and it can safely be turned by an "el-cheapo" Radio Shack style TV antenna rotator.

Its bandwidth is such that you don't need a tuner IF your rig can take a 2:1 SWR without complaint (e.g., tube finals). If you have solid state finals, you will find the bandwidth very narrow (or you'll have to use a tuner).

It's moderately time consuming--but not too difficult--to assemble. Reports ranged from 3-7 hours for assembly. Construction quality was rated as very good to excellent.

Tuning it is another story. The loading coils/elements/whatever interact such that getting it tuned on all bands can be a real pain. One person reports finally giving up on tuning for 12 m and using it as a 3-bander. It must be tuned while mounted on the mast.

One person reported that the antenna should be at least 30' off the ground.

It has essentially no directivity and no gain. Many reported not being able to see any difference in signal strength when the antenna was rotated.

As one person put it, "It's at least as good as a full-sized dipole." Another speculated that its performance on 20 would be better than a wire dipole. Finally, one commenter wrote 'it is vastly superior to the usual "low profile" antennas such as bent dipoles and loaded rain gutters!'

Summary: It's a good antenna, but don't confuse it with a real beam. If you want real beam performance, you have to get a real full-sized beam.

Now my request for advice: I am looking for an antenna to augment the center-fed Zepp run through the trees next to my house. Money, neighbor and XYL concerns dictate no tower and no full-size beams strapped to my chimney :-(. The Butterfly looked like a good choice, but if it's not going to outperform my dipole, I'll save my money. Any suggestions on what I should buy? AEA Isoloop? Cushcraft R5? (How tall is the R5, anyway? The R7 is 22.5 ft. tall, likely a bit too much to attach to the side of my house.) Or should I just save my pennies, buy lots of wire, and put up another dipole or a Sherba curtain (see QST Oct '91)?

Please respond directly to me via e-mail. Thanks in advance.

Jon

This makes perfect sense to me. The Ringo "doesn't need" a ground plane
because of the ring thingie on the bottom, according to the manufacturer.
In fact, with no proper ground plane, I expect the Ringo tends to let
RF current flow on the supporting mast which messes up the radiation pattern.
Some people do seem to have good luck with these antennas -- I suspect it
is because their masts/feedline/etc. are anti-resonant at the transmit
frequency and thus don't have too much stray current. Others who aren't
so lucky have poorer results.

I love old radios as much as the next ham, but radium is something you do *not* want to mess with. Back then, nobody understood the danger of long term exposure to low levels of radiation, or of ingestion of radioactive substances. Those were the days when they were blowing up a-bombs in the desert just for the fun of it (basically) and putting uninformed soldiers virtually under the bomb (in some cases within 1/4 mile) just to see what happened. If the GIs didn't drop dead on the spot, they figured everything was ok. If you go mucking about with the radium paint, you could scrape off a small dust speck, and then inhale it. That little spec could lodge in your lungs, where it would irradiate the tissue there for the next 5,000 years or so. This is very bad news. Just because the government (and the military at that!) put the radium paint on the things doesn't mean it's safe. It's much, *much* more dangerous than anyone knew at the time they built them. Exposed radium paint should be handled like the highly toxic substance it is.

(lots of other stuff deleted) Since I don't know exactly what tubes you are talking about here, I may be thinking you are saying something you aren't (:-) -- but I think it's important to distinguish between the plate impedance --that is, the partial derivative of plate voltage with respect to plate current in the tube under particular bias conditions -- and the optimum load impedance, which is typically much lower than the plate impedance for a pentode or tetrode. There is no reason you cannot operate a pentode directly into a very low impedance; you just won't be letting the plate voltage vary very much, so the efficiency will be really low. And you will get out only as much current as the tube can handle, whereas if you transformer couple, you can step the current up by the turns ratio.

I think you will find that the output impedances of good tube-type audio power amplifiers are quite low, as evidenced by their damping factors. That's achieved with local and overall feedback as well as by transformer coupling. Without feedback the output impedance could well be many times the rated load impedance, just as it can be with either bipolar of power FET solid state amplifiers.

3104. Some comments on the AR1000/XLT ... Kinda like a review !

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-25 21:29:02 UTC
From: gary@kimbark.uchicago.edu
Message-ID: <1991Sep25.212902.1245@midway.uchicago.edu>
Source record: 293285
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave

FYI - The AR1000XC/XLT is now readily available from ACE (1-800-445-7717)

Or that appears to be the case. I had my AR1000XC on order for months from Grove. That finally was cancelled by Grove and the line of AOR scanners dropped from the catalog due to problems with the supplier (ACE, I assume)

Well, I still wanted one. So, I called ACE and ordered from them. They told me 2 to 3 weeks. So, I braced myself for another long wait. Surprisingly, I got it in about 4 days.

So now I have one! Do I like it? Well, here's a few comments after several days of use.

So many channels.... too few banks.

1000 channels. Isn't *that* enough? Well, yes and no. What the people that design (obviously not *use*) these things is that 1000 memory channels are nice - but, in 10 banks of 100 channels its not as useful as it could be if there were more banks and less channels per bank. My PRO2006 has 10 banks of 40 channels - kinda ok. The AR2500 (which I used for a while) has (if I recall correctly) 64 banks of 32. Thats the way to go. (And, the AR2500 had an RS232 interface to load those 2,000+ channels. That's the way to go as well!!!)

What I've done with my 10 banks of 1000 channels in the AOR1000XC is to make use of the channel lockout feature to create 20 banks of 50 channels as the cost of ease of use. I have my scanning freqs divided into categories (Chicago Police, Fire, Ill State Police, FBI, Marine, Ham repeaters, aircraft, etc). Locking/unlocking 50 sequential channels at a shot is not a friendly thing to do - but it does work and it only takes about 30 sec. I keep track of all this on my Mac with a spreadsheet (EXCEL).

1,000 channels. No, really 2,000 and the latter most useful...

One unique feature of the AR1000XC that has not been on any scanner I've used (PRO2006, AR2500, ICOM-R7000, Uniden, etc) is that of scan bank freq lockout memories. Now, this is really slick... and allows one to readily deal with birdies. Each of the 10 (what AOR calls SEARCH banks - upper/lower freq limits - not to be confused with the SCAN banks of 1000 memories in 10 banks of 100) has 100 "lockout" freqs. For example, if you are scanning 144.0 - 148 Mhz and there is some annoying signal there (we have weather via RTTY here is Chicago) you can lock it out when the AOR1000XC stops on it. That is, add it to one of the 100 lockout memories in that scan bank. On the next scan through the limits the AOR will ignore this freq. Nice way

of dealing with birdies!! Other scanners should have this.

No batteries required...

Like the AR2500 and unlike almost all other scanners, the AR1000 uses an EEPROM for memory. This means that there is no dependence on a lithium battery (or capacitor) to hold the contents of your 2000+ memory channels.

Pretty slick. Just as an aside... I'm no EE but I do recall that EEPROMs are only writable a finite number of times... like 800-1500 times. A small consideration but interesting fact. (Correct me if I'm wrong)

S-meter

I want one - plain and simple. I want an S-meter. I want an S-meter
Got it ?

Antennas

Give the AR1000XC a break. People tell me they can't get any Shortwave on this thing. Get rid of that antenna. The rubber-duck thats supplied with the unit won't do it. The Users Guide (more on this, see below) says so and they're right. I use about 20 feet of wire attached to the antenna jack and thats 100 times better than what you'll hear on SW using the rubber duck. The SW comes in about as good as my Sony ICF-7600 ($129). Not great - but, acceptable.

Another word on antennas. I learned my lesson on a ICOM 24AT. Too much antenna changing will loosen the BNC connector from the case and possibly break internal connections.

Here's how I've solved this problem. Go to RS and get a BNC->Coax(SO) connector and Coax(PL)->BNC connector. Looks weird adapting a BNC to a BNC in this way but, you'll be unscrewing connections rather than twisting a spring loaded BNC connector which, if a tight fit, will eventually loosen the BNC connector on the radio from its case. Also, this has the advantage that it readily accepts a connection to a "real" antenna with a PL-259 as well as the rubber duck.

Bottom line - Use a longwire for SW listening.

The Users Guide

If you can call it that. Only "real men" need apply. The "User Guide" is 2 pages both side of small print that describes how to program this unit. You'll also get a one page "cheat sheet" (in large print) that summarizes the programming. It took me a few hours to learn how to program this. You'll also get a freq allocation table and an invite to subscribe to U.S. Scanner News

It wont win a beauty contest...

Appearance-wise, the AR1000XC looks ugly. Its made out of cheap plastic with a most disgusting rubbery/vinyl case. My unit has a weird waxy film over the front panel that makes the display a little "frosty" looking.

I called ACE about this asking if this was some "protection" [of their highly sophisticated and professional looking instrumentation :)] that was intended to be removed. They told me it was a protective film and can be removed if I like. "But don't do it". (Like maybe the lettering on the front panel would fall off :)) Quite a difference in look among with AR1000XC and things like the ICOM W2A, R1, 2SRA.

Technical Support....

Gee, you can call up ACE on their 1-800 number and talk to a real live techno-geek-wizard that knows everything about the AOR line of scanners. Its the guy who does board-level repairs and trouble shooting. He might even tell you the functionality that's going to be programmed into the next AR1000XC/2 micro-controller...

Misc comments...

The WBFM broadcast band audio quality is excellent. Some people say the AR1000XC has low audio output level. Mine has more than adequate volume in all modes.
The display light is way too dim.
You need to look at the display at about a 45 degree angle from the bottom to see it clearly. The waxy protective film doesn't help visibility.
Programming is complex.... it takes a bit of work to do very simple things ("one-touch" things on a PRO2006) like including/excluding sets of search & scan banks. Its easy to wipe out memories in "manual mode". There's few/no LCD "prompts" that jiggle your memory on what has to be entered next. I'd like a "confirmation beep" on the keypad and conclusion/acceptance of programming function.
It hears 800Mhz well enough to get you arrested. But, you can get out of it saying that you didn't quite understand what was said.... the AR1000XC has poor audio quality on 800Mhz.
It hears AM aircraft well enough for you get out of the way of lost Delta Airline pilots if you live near a airport.
It hears SAC on Military AM aircraft band (220-400Mhz)
It doesn't hear AM broadcast - yet - I need an antenna.
Batteries (600 ma Sanyo) are supplied as is a wall charger and 12v power cord for your car.

Other stuff I'd like to see on every high-end scanner

Freq Centering ...
The PRO2006 has some kind of freq "centering circuit". In scan mode, the PRO2006 never seems to "stop short" before locking onto a freq. The ICOM R-7000 and AR1000XC could never pull this off. For example, when scanning the 2m ham band, in 5 Khz increments, both the ICOM R-7000 and the AR1000XC will stop 5 or even 10 Khz too short of an active signal/repeater. You need to "bump" these guys to get 'em to lock on the freq. The PRO2006, scanning in 5 KHz increments always centers on the frequency.

Sound Squelch...
The PRO2006 and ICOM R-7000 have a "sound squelch" that will ignore

unmodulated carriers. Nice thing to have. Works entremely well on the PRO2006.

Configurable memory and banks...
I'd like to see "configurable" memory banks. When I was in college I had a programmable TI calculator that one could configure "memory" and program space. If you had a big program you could increase the program memory at the expense of register space. How about giving me a like option on a scanner. Give me "1000 memories" to be divided up into banks as I see fit appropriate to my use. 50 banks of 20 would be nice. Let me use those other 1000 "lockout" memories on the AR1000XC as regular memories for a 2,000 channel scanner

Search and memory write..
A nice feature on the ICOM R-7000 and an aftermarket possibility on the PRO2006. Give me the option on scan that writes found freqs into a 100 channel bank. Put a clock in the thing so you can also time and date stamp the entry.

This is the 90's right !?
Put an RS-232 interface on it! The AR2500 has one. The ICOM R-7000 has one. The PRO2006 should have one. There's a single chip micro-controller out there with a serial port and built in BASIC. Why don't we have a scanner built around something like this? Computer control of a PRO2006 is an aftermarket possibiliy - at a very high price.

Keep track of my battery please....
In this months BTYE magazine there's mention of a $10 chip that monitors Ni-Cad battery drain levels and duration. Based on this, a micro-controller can accurately predict the remaining capacity/life of a Ni-Cad battery. Ok for scanners. But, great for HTs. The discharge curve for a Ni-Cad is pretty much flat until total discharge. That is, you can't tell from the voltage anything about remaining capacity. Not only could this $10 chip tell me how much battery capacity I had left but also, (asking for alot) discharge my battery at high drain in a controlled way as a prep for quick charging. (Thus reducing possibility of battery damage.)

==========

Bottom line. Hard to call on the AR1000XC. Whether I would recommend this unit is dependent on your requirements. If pocket-portability is not high on the priority list, if you have $400-$500 to spend, if you want to listen to VHF/UHF as well as Shortwave ... get a PRO2006 ($349) and something like a Sony ICF-7601 ($129). The AR1000XC is a compromise - but it has everything in one radio.

1,000 memory channels. Sounds impressive. But, do you really need 'em ? 400 channels is about enough for even the most compulsive/voyeur scanner person. I have about 300 channels programmed into my PRO2006. The only use I can see for an excessively large number of memory channels is if you are looking for something. Like, scanning the huge 220-400Mhz Military aircraft band for activity. I have a list of 100s of freqs in this band.

Being able to program all these freqs into memories, and do a channel scan for activity is much more efficient than scanning low/high limits.

Of cource, most important of all, is that you have the latest, coolest gadget on the market - whether you really need it or not. That alone could justify buying a AR1000XC. Works for lots of people... Heck, I even have a NeXT machine :)

Prioritize your requirements. It will help you decide if the AR1000XC is a good value.

Any advice on 2m and 220MHz antennas for attics? I live in a townhouse
and can't put anything outside. Fortunately I'm on a hill and so
can hit most repeaters with the rubber duck, but on some I'm kinda
noisy. I have 5 feet of clearance in the attic. Some outfit in
Mississippi (MLB?) has quarter wave ground planes for like $12. Any
good? Would a Ringo ($35) do better? There are 2m repeaters in
all directions, but I use primarily 1 220 repeaters, so maybe a
small yagi for that? Any advice welcome.

>If you try them that way, let us know what happens!!

I've tried the same units (also sold by Maxon) for bike-to-bike
communications. The first problem I had was the VOX was set off by the
wind noise on my unfaired bike, even on the least sensitive position.
So I experimented with different resistor values until I could go up
to freeway speeds before they kicked on. The next problem was range.
I ordered the loading coil portion of the original antenna's so I could
build a similar unit which would work with the helmets. Range was
still pitifull, however, especially at any speed. On the Interstate I
found I had to be pretty much right next to the other bike to hear
them. The other problem was that large amounts of wind noise were
being transmitted, even with a full face helmet and foam over the
microphone.

I finally gave up on the 49 MHz transceivers and switched to CB's,
which eliminated the range problem, though still requiring various
modifications to deal with the wind noise.

> I got a *measured* 10 db improvement from going to a AEA Isopole instead
> of a Ringo (note Ringo not Ranger) in the same location fed with the same
> cable. This leads me to believe that the Ringo has negative gain.

There are three different Ringos offered by Cushcraft. Not all Ringos are
created equal.

The Ringo (AR-2): half-wave, 3.9ft tall, 3.75dB gain,
16 degree horizontal radiation angle,
10 Mhz bandwidth with 2:1 SWR.

The Ringo Ranger is (2 x 1/2wave?) and is 9.3ft tall, 4.5dB gain,
6Mhz bandwidth with 2:1 SWR.

The Ringo Ranger II (ARX-2B): 3 x 5/8 wave, 14tf tall (~9foot above
mounting mast), 7.0dB gain, 7 degreee horizontal radiation angle,
3Mhz bandwidth with 2:1 SWR.

FYI:
The dual band (144/450) AR-270 Dual band ringo: 3.75 ft, 3.7dB-2m, 5.5dB
on 440, 4 Mhz bandwidth on 144 and 15Mhz bandwidth on 440.

My new Ranger II gives me about 2-3 S-units more signal than my (American
Legion) Jpole (5/8 wave) antenna. The jpole should perform similarly to the
small (1/2 wave) Ringo.

I can reliably work distant repeaters that I could barely work with the J
pole. I like the Ringo Ranger II!

Isn't LDE something else besides hearing your long path signal? I thought that the delay of the elusive LDE was something like a second or several seconds.

It takes an HF signal approximately 0.14 second to circle the globe. This can be heard fairly regularly in NA by listening to some of the big domestic VOA transmitters. The time delay varies, of course, with the distance between the transmitter and receiver.

My Xicor data book contains a good discussion of EEPROM reliability.
They specify some mininum number of write cycles before a location
"wears out"... (oxide failure, I recall). I think a typical lower
bound is 10,000 cycles and a typical value is 100,000 cycles.

3112. Yaesu FT 470 Extended Tx. (side effect from keyboard Entry Mod.)

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-26 04:14:46 UTC
From: Gogian_Yee.ES_GSD/WCO@xerox.com
Message-ID: <"25-Sep-91.21:14:46.PDT".*.Gogian_Yee.ES_GSD.WCO@Xerox.com>
Source record: 293280

I discovered a side effect from using the Keyboard Entry Modification... I noticed by accident that when inputting a frequency (from 140 Mhz to 155 Mhz instead of the usual 144 to 148 Mhz range), and setting the standard frequency offset of 60 Khz or none at all), i could Transmit. I used a dummy load on the HT and experimenting further and discovered i can use either the standard offset (- or +) or just plain simplex mode and still be able to Transmit without getting the usual "ERROR" message on the display. I verified the transmission capability by using my Scanner and a Spectrum analyzer with a small whip antenna to monitor the output of my Yaesu FT 470 at work. At the Low Power setting, with a 7.2 volt battery, i was able to get approximately +46db at the 0db attenuation level on the analyzer using from 140 Mhz all the way to 155 Mhz range, so the transmit level at the extended frequency ranges of 140 to 144 Mhz and 148 to 155 Mhz matches the same Transmit level elsewhere in the band. That's 4 Mhz and 7 Mhz respectively on the extended Transmit!!!
This side effect comes about when you use the Extended Frequency Keyboard Entry Mod. That's when you select a VFO and enter "50 Mhz), set offset to zero by entering four zeroes, turning the HT off/on, hitting FM key and then REVerse key, then RPT to either "-" or "+" and pressing REVerse to select the frequency range(s) you want and storing the Upper and Lower limits...
You might want to try this side benefit yourself and see what you come up with...
I tried to 70 cm side, but the side effect isn't to be found (yet), but i'm still experimenting with the 470.

>this is 23-to-1 turns ratio. Yet the tube plate impedance is 33K
>which will reflect to 63 ohms at the speaker.

My 60's GE tube manual has the same figures, except that it lists the 33,000 ohms as plate resistance; for a single-tube class-A amplifier. I realize that plate resistance and plate impedance are essentially the same at audio frequencies, since the effects of inter-electrode capacitance is slight: 6.5 pf (from a Sylvania tube manual) yields an X-sub-C of a little over 1.2 megohms at 20kHz, and this value paralleled with the plate resistance gives 32.1K ohms. In practice, the load impedance is effectively in parallel with the plate impedance, so in the case of the 6L6, it would result in an effective 3250 ohm source looking at an 8-ohm secondary winding. These figures yield a turns ratio of 20:1, and a reflected impedance of 7.1 ohms instead of 63 ohms; without feedback.

>Assuming the output amplifier uses 20 dB of negative feedback, the amplifier
>output impedance will be 6.3 ohms.

This amount of feedback, using my figures, would lower the impedance that the speaker sees to .71 ohms, a not-too-bad damping factor for such an inexpensive tube amp.

3117. Parts wanted for Toko (Juli) TVRO site survey dish

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-26 08:00:00 UTC
From: die@cpoint
Message-ID: <14837@cpoint.clearpoint.com>
Source record: 293132
Cross-posted to: rec.video.satellite,rec.radio.amateur.misc

Does anybody know where to obtain parts for a Toko (Juli)
collapsable C band satellite dish ? These antennas were made and
sold in the early days of TVRO as portable dishes on a tripod that
could be set up anywhere and came in various sizes up to 12 feet.
They unfold like a large black beach umbrella with a central pole that
is really a circular waveguide and use a reflector feed so the LNB
goes behind the dish. The dish and tripod fold up into an object
that can be reasonably easily carried by one person like a beach
umbrella.

These antennas were widely used at one time by TVRO dealers
to do site surveys to figure out where to place more permanent dishes
and to check for problems with terrestrial microwave interference
and shadowing by trees and obstructions.

I have owned one for a number of years - a couple of days ago
it got loose from the ground anchor I was using and flipped over in
an unexpected wind and rain storm. This broke the plastic ring
that holds the stress wires and mangled the feed reflector. Both
parts are eminently replacable if I can find a source for them - if
anyone knows where to buy them or has an old Toko dish that has the
parts on it they would sell I would appreciate hearing from them.

Source record: 293287

Tom Taormina, K5RC, writes;

<...First of all, LDE (Long Delayed Echo) really does happen. It's happened
to me twice in 32 years, both times on 20 meters. It requires an ideal
combination of reflective and refractive propagation to allow you to
hear yourself coming around the world. The delay is less than 1/4 second...>

This is NOT LDE! Long Delayed Echoes have Long Delays, i.e 10 or 15 seconds. We had a guy from the Rutherford-Appleton lab come and talk to us about LDE at the radio club last year. He did a study of LDE as part of his PhD thesis. He built a piece of automated equipment which did a sort of "long delay" "radar" by sending automatic CW and listening for echoes. He ran the equipment for two years, sent over 2,000,000 pulses and never recieved a single LDE, despite rigorous calibration of the equipment.

He also played a tape of a "real" LDE. Personally, I think it's all a hoax.

I can look up some references if anyone's interested.

Regards,

Hugh, G0CNR.

3121. Azden 700 Review

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-26 11:59:50 UTC
From: weh@metropolis.super.org
Message-ID: <49524@super.ORG>
Source record: 293294

I bought the Azden 7000 while waiting for my first license.
I have been using it since 7/23/91.

I have it hooked directly to the car battery via twisted
pair and I am using a larsen 5/8 mag mount antenna.

The overall review if the Azden is "In my limited experience
I have not seen or heard of anything with more features
than the Azden. I do not think you can beat the price. The
radio works great."

The 2 meter portion of the radio transmits fine quality
and the receiver receives well without getting bonked
by a building full of paging antennas (the paging antennas
do get into the handytalkies.) I almost always run the
radio on 10 watts instead of 50 watts.

There are two banks of memory with 10 channels each plus
one temporary memory. Either or both banks can be
scanned. I put aircraft, police, and marine frequencies
in bank B and all the 2 meter frequencies in bank A. I put
the weather frequency in the temporary memory. If life is
dull I scan bank B or push the temporary memory recall and
get the weather.

The touchpad on the microphone keys the transmitter when
one of the touchkeys are pressed. So to make an autopatch
you do not have to hold the PTT. There is no lockout
option for the keypad but I have never accidently hit
a keypad button (my carpool rider (also a ham) has however.)

There is a button on the microphone that takes you to
memory channel A0 (where you keep the frequency of your
favorite repeater.) Pressing the button a second time takes
you back to where you were.

When listening to the aircraft frequencies you need to
be within about 3 miles of a major airport to receive
the control tower. The traffic from the planes you
can receive no problem. It is interesting to listen when
you are near an airport but dull and boring otherwise.

Sounds like a great idea - I tried building myself one once, but I couldn't find a mike that was good/small/cheap enough.
In fact, I liked the sound of this so much, I rushed out to my local TANDY (Radio Shack for us Brits), and asked the price. 69.95 POUNDS! Hmmm...

Don't suppose that anybody knows if this is one of those "Tandy/Radio Shack" products that is really someone else's with a Tandy badge added along with about 20 quid on the price. If so, who _really_ makes it?

Shame really - nice idea, shame about the price difference!

Jason.

3124. CMOS SuperKeyer II line voltage Mod help

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-26 13:40:00 UTC
From: JMG%TNTECH.BITNET@cunyvm.cuny.edu
Message-ID: <01GB15940WYODXY8O0@TNTECH.BITNET>
Source record: 293292

I just ordered the partial CMOS Super Keyer II Kit. It will be my first attempt at assembling something from a schematic. I noticed in the article that it is designed for a positive key line. My rig has a negative key line.

The assembled version called the Logikey K-1 has provision for both.

Does anyone know what I would have to do to modify the original wiring scheme to accomplish this? Or do I need to just go ahead and build an inverter (as mentioned in the article).

Help is greatly appreciated.

Thanks in advance.

Yes. I have purchased one and played with it some. They sell for around $1K in Japan. I expect the price will fall.

Basicily, it reports you position (long, lat, and altitude) to within about 50 feet. It also does way points and course plots, etc.

It reports your heading and speed and/or the speed and direction of your next way point.

It also gives you the time of day to within 20 nanoseconds.

Applications:
It works great on a boat. It is good backup to Loran and is very happy when it can see sky in all directions. Cost effective and nice for boat owners.

Works well in a car. It seems to report the same speed as the speedometer and you can program it to beep when you get to your exit. Overall it is less useful in a car than on a boat.

It does not work well on commercial airliners. You have to point the antenna out the window and it only gets to see 1/2 the sky. You also have to explain to the flight crew and the security people what it is. ("Sony version of the Nintendo Game boy" works best. The truth works very poorly)

Bugs:
It assumes that the earth is flat. This is OK in a car or boat or even if you want the beam heading from your shack to the local repeater, however, if you want the beam heading and distance from Boston to Perth, it will not work. It also has problems telling

you how far you are from JFK if your plane starts in NRT.

It draws a great deal of current. While it runs on 4 AA batteries, they have enough internal resistance to keep it from seeing the full six volts it needs. I think there is a lot of GaAs stuff in the front end. If you take along a 12 Volt gel cell and the car adapter, the GPS works much better. (Of course, the airport security people like that even less than the GPS)

I was able to obtain a photocopy of the English manual from the nice lady at the Sony demo center in Ginza. The "official" Sony position is that no English manual exists.

I will write a more complete description and review if there is any interest and I get the time.

I remember that song. It was an attempt to get a four letter word
ending in 'K' and meaning intercourse (not TALK!) to be transmitted
over the airwaves and past the censors... It came out at about the
same time I got my novice license, back in '70 or '71, and a friend
of mine (who never got his license) had the album. Pretty heavy
stuff for 13 year olds... I don't think I ever heard it on the radio,
just on my friend's turntable... (Censors aren't as stupid as they
seem to be, eh?)

I've been packing up the shack ready for the next house move. (Boy does
one ever acquire a lot of "stuff" when in a house for a few years and
actively hamming). Anyway I've come to realize that parts of an HF
mobile antenna are missing, I think they must have been lost in a
previous move. It's a loss of sentimental value more than anything,
so I wanted to share my grief and enquire whether anyone else has had
a fondness for the long departed Swan/Cubic M34 HF mobile antenna system?
Anyone else even remember it? It convered 10,15,20 and either
40, 75 or 160 in a single (weird looking) antenna. I suspect this antenna
was sold under some other name(s) also. The vendor to Cubic (I have
discovered) was G-Whip Products, Bryn Coed, Wrexham, North Wales.
I can just picture them being made in a tiny kitchen in a miners cottage.
Flash forward to present, our intrepid researcher arrives there today
and is told "Oooh yes boyo, that was GW6DJ Dai Jones who made themm,
raydio man since before there were Bee-batteries, died ten years agoh now,
no-one left to carry on after him see. "
Seriously, does anyone out there still use one of these, care to
reminisce about them.
Got one collecting dust somewhere? - I know a good home!

[EXCELLENT summary of TRC-500 usage removed]

>We got outside interference when passing through some urban
>neighborhoods, 3 times suring the trip. It usually lasted for 1/4
>mile.

I've used these units many times in car-to-car conversations, though
without the helmet mods. The frequency used is the same as baby-room
monitors from Fisher Price. If you listen carefully, uou can sometimes
hear a child playing, some music (those little wind-up thingies), or
just noise. The range for the monitors is as states, about 1/4 mile.
Identifiable by a low-range hum, as opposed to just 'static'.

Dunno if broadcasting on the TRC-500 makes it come out of the monitor,
but just in case, I usually keep quiet in these areas ;-).

>Range: The units did not perform to the advertised 1/4 mile range,
>probably due to the alteration of the antenna, more than anything else.
>My informal test gave us a range of 200-300 feet.

I wonder if a modification can be made for an external antenna linkup?
Could someone wise in the ways of radio-dom e-mail me specs on mounting
an external antenna for better range (say 2-4 miles?)

3137. Minor Geomagnetic Storm Alert - 26 September

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-26 19:10:08 UTC
From: oler@hg.uleth.CA
Message-ID: <0094F38A.D19C60A0.3462@hg.uleth.ca>
Source record: 293306

/\

GEOMAGNETIC STORM ALERT

ISSUED: 12:00 UT, 26 SEPTEMBER

/\

ATTENTION:

A minor geomagnetic storm materialized between 06:00 UT and 09:00 UT on
26 September over the middle latitude regions. Periods of major geomagnetic
storming have been observed over many middle latitude stations. This
activity should continue for another 24 to possibly 48 hours before beginning
to wane.

The auroral oval migrated equatorward during the period to approximately
the 50 - 53 N Latitude position during stronger substorm periods. Despite
this, the phase of the moon severely limited auroral observations even over
the northerly middle latitudes. This disturbance is not expected to be as
visible as previous disturbances because of the lunar phase.

HF propagation conditions became degraded over some middle and almost
all high latitude and polar paths during the local evening and early morning
hours. However, daytime propagation conditions over the low and middle
latitudes should remain relatively stable. Conditions will not be as
favorable for communications as they have been over the last week or so, but
should not be degraded too significantly over the low and middle latitudes.
Poor propagation conditions should dominate the high and most polar paths
until after this disturbance begins to abate.

** End of Alert **

3138. Mid. Lat. Aurora Watch Upgraded to a Warning

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-26 19:37:08 UTC
From: oler@hg.uleth.CA
Message-ID: <0094F38E.973ADD20.3628@hg.uleth.ca>
Source record: 293303

/\

MIDDLE LATITUDE AURORAL ACTIVITY WARNING

UPGRADED: 17:00 UT, 26 SEPTEMBER

/\

HIGH RISK PERIOD: 26 - 28 September (UT days)
MODERATE RISK PERIOD: 26 - 30 September

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: MODERATE

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: >50 North Latitude

POTENTIAL LUNAR INTERFERENCE: MODERATE - HIGH

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: FAIR - GOOD

The Middle Latitude Auroral Activity WATCH has been upgraded to a WARNING as of 17:30 UT on 26 September. Conditions are favorable for auroral activity observations from many middle latitude sites. This opportunity will not be as favorable as previous opportunities due to the position and phase of the moon, but should still be sufficient to provide fair to good opportunities for observing aurorae during the local evening and early morning hours.

This disturbance should endure for another 24 to 48 hours afterwhich a gradual decline to more dormant levels of activity should be observed. This warning will remain in effect for the UT days of 26, 27 and possibly 28 September. No low latitude observations are anticipated at this time.

** End of Warning **

>tube amp.

Using your figures, the tube will "see" a load impedance of 8 * 20^2 = 3200
ohms. The transformer primary (looking back toward the tube) will see
the tube's plate impedance, 33k. So the impedance presented at the
transformer secondary will be 33000 / 20^2 = 83 ohms. With 20 dB of negative
feedback, the speaker will see a 8.3 ohm source impedance.

The only thing I am unsure about is the amount of feedback typically used
in tube amplifiers. My fuzzy memory is that it was on the order of 10
or 20 dB. I believe a class A push-pull tube amp can do less than about
1 percent distortion with no feedback, so not much feedback was needed.

> Dube AB5AP

This is actually done in the Futterman amplifier which has been on the market
now for about 30 years. I don't know if Futterman uses 6AS7's, but there are
a bunch of tubes in parallel driving the speaker without an output transformer.

BTW, this discussion belongs on rec.audio!

3141. Comments on GRE Product Quality

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-26 21:22:33 UTC
From: tpavek@kpc.com
Message-ID: <1991Sep26.212233.27362@kpc.com>
Source record: 293324
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc

Has anybody got an opinion on any of the GRE products ?
I'm asking because my "Super Amplifier 3001" gave up about 2 weeks ago.
It is less than 6 months old.
For those who may be unfamiliar, it is a variable gain amplifier designed
for base model scanners. It was a real nice unit, appears to be a 2 stage
amplifier utilizing surface mount technology.
I thought SMT would last forever, and I'm sure I didn't zap it.
Unfortunately it comes with (only) a 90 day warranty.

I called GRE, they will fix it for $25, plus parts and postage.
I'm wondering whether or not to have it fixed, bacause I can get a fixed gain
unit from Hamtronics for approximately the same price, AND it comes with
a schematic.

Opinions ??

Geomagnetic Field	Fri	Sat	Sun	Mon	Tue	Wed	Thu	Fri	Sat	Sun	Anomaly
Conditions	Given in 8-hour UT intervals										Intensity

CONFIDENCE LEVEL: 65%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

Chart Start: Day #209

GRAPHICAL ANALYSIS OF 90-DAY AVERAGE SOLAR FLUX

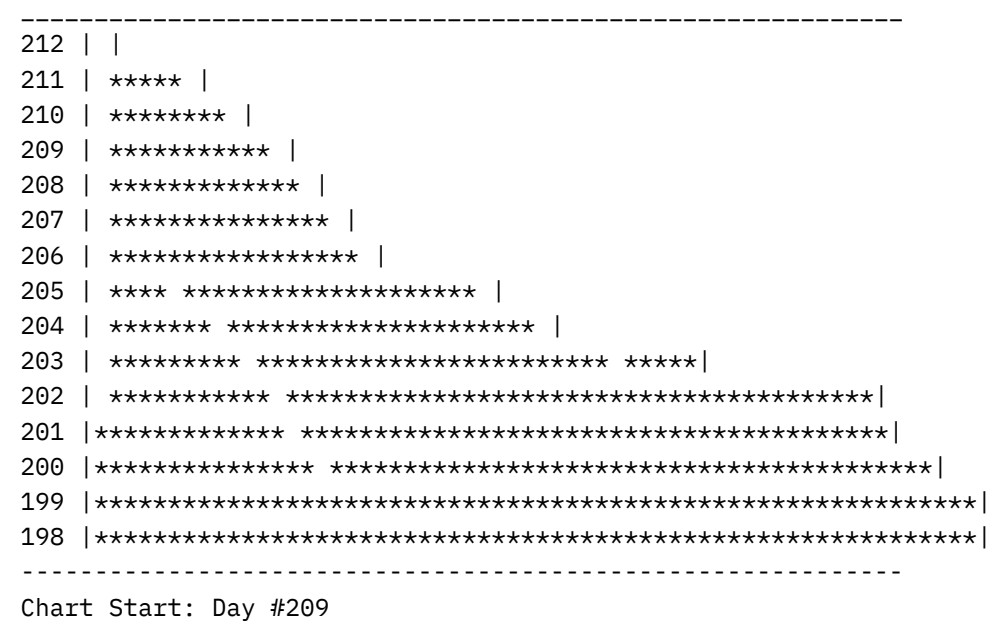

Chart Start: Day #209

NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

>AL N1AL

The "mic" of a standard telephone set is a carbon type mic, which
is a variable resistance. I'm not sure that you could say that
it HAS an impedence. The earpiece should be nominally 900 ohm, but
I may be wrong.
FYI the "normal" telephone subscriber loop is 900 ohm nominal, not 600.

3146. Help? FT-470 HT and packet

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-27 03:27:56 UTC
From: ajk@garnet.berkeley.edu
Message-ID: <1991Sep27.032756.22297@agate.berkeley.edu>
Source record: 293311
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet

I'm relatively new to amateur radio: got my ticket over a year and a half ago, but I've been out of the country for most of the intervening period, so I haven't had much practice all told.

Today I picked up the first ham gear I can call my own: a Yaesu FT-470 HT and an AEA PK-88 packet controller. Here's what I would like to ask any helpful net amateurs who have experience with this or similar setups:

1. Does anyone have the exact wiring specifications for the Yaesu side of the cable to the TNC? Is "where do I plug it in" a stupid question? Presumably the MIC and EAR jacks, but how is the MIC jack configured -- if it's (as the manual specifies) a 2-conductor micro-mini phone jack, then what do I do with the PTT signal? Or is there something else I should know? I can wire the cable all right, but I have no appetite for blindly trying configurations on an expensive piece of equipment. Do I have to open the unit up?

2. Suppose I want to run the HT off a 12V external power supply. Where do I feed the power? Not the battery terminals, I hope. I would have expected a DC power jack somewhere on the unit, but again I don't see anything except a mysterious looking rubber plug-which-might-hide-a-jack-but-I'm-afraid-to-pull-it-and-look. The manual, again, says nothing about this.

3. Anything else (useful modifications, hints, caveats) I should know about the FT-470 (or PK-88?)

Thanks in advance for any advice given this slightly bemused new ham (I consider myself competent in analog and digital electronics, but faced with an expensive micro-miniature powerhouse like this thing, my main instincts are "HANDS OFF UNTIL YOU KNOW WHAT YOU ARE DOING!")

Source record: 293322

EM> Well, the $25 garage-sale special (_old_ Heathkit 80/40/20/15/10
EM> receiver, transmiter and vfo) is cleaned up, tuned up, and seems to
EM> be working. It's not flashy, but fits the current budget very
EM> well. Now the question is: how can I set up a transmit/receive
EM> switch without spending more than I did on the rig?

Most of the older Heath rigs provide 120vac somewhere on the back panel
for a T/R relay, and at HF and those power levels you don't need anything
fancy. Almost any old 120vac relay will do; if you want to put it in an
aluminum minibox with connectors, fine, or you can solder coax directly to
the terminals. Makes a nice >>clack<< when you switch to transmit. Downside:
won't provide full-breakin keying, but it WILL put you on the air.

From: skipsand@crash.cts.com
Message-ID: <1991Sep27.041253.26083@crash.cts.com>
Source record: 293315

The Blue Angels use THREE frequencies in the air... the two given previously, and either 302.15 or 307.7 (Usually) -- the third is the ALL aircraft master channel.

The 142 - 143 channels are supposedly no longer used, reportedly because a ham tried to TALK to the Angels on those channels with a modified ham HT, causing the Angels to move to all UHF air to be less jammable.

> 3Mhz bandwidth with 2:1 SWR.

I wondered about this. The cushcraft propaganda says its really 3-5/8 wave
elements stacked, but if you look at it, theres the phasing stub thing, and
the ring thing. So, wheres the 3rd (bottom) element? is it the cable?
somehow I doubt that. Theres nothing under the coil thing that even looks
like it might be a radiating element. Did i miss something obvious?

Source record: 293316

In an earlier article, nsc!voder!berlioz.nsc.com!green at decwrl.dec.com
asked about the ICOM 720A. I have a plain old 720 and am very happy
with it. If it has the 6 KHz crystal filter it is an outstanding
performer on AM for swling and such. The radio can easily be
controlled with any computer's parallel port with a simple interface.
The performance on SSB and CW is very good, easily the match in
selectivity and the superior in audio quality to my JRC NRD-525.
I bought the radio on Guam, and have uu!sed it there, maritime mobile,
at three stateside QTHs, and in Sicily. It is rugged, compact, and
a good performer.

The only potential problem is that these radios are 10 or so years
old, and I had heard rumors that ICOM no longer had special parts
support for this radio -- specifically the stepping relay/switch
that is used for bandswitching. I haven't had any problems with mine,
but others have.

... neither do I.

A friend of mine and I bought the upgraded pair for $89.95 - this included EAR mics (see earlier thread this group for more on these - I tried to put this in then, but my system was broke...)

The main difference between these radios and the ones John described (besides the ear mic) is
1. The ear mic lead between the radio and the earpiece is NOT on a jack - you can't remove the cable from the radio.

2. There IS a jack at the earpiece

3. The antenna is the lead to the earpiece

Since my friend & I DID use these for inter-bike communication, I will comment on our experiences:

1. Range was greater than what John described (maybe because of more antenna) - perhaps the 1/4 mile advertised, maybe a little more.

2. The ear mics come with 4 different sized inserts for custom-fitting your ear. Unfortunately, there are actually only 2 sizes (2 of each), so you have your choice of too big or too small. The inserts are made of what appears to be a hard variety of silicon robber - too stiff for comfort for very long.

3. It is CRITICAL that a good seal be achieved between the earpiec and the ear - the mic is quite sensitive. with the earpieces supplied, neither of us could achieve anywhere near a good enough seal to permit VOX use - he has a closed-face helmet, and I have an open one.

4. The ear mic is a good idea, but it suffers greatly in that it does not get the sibilants (s, f, etc) - they don't make it up the ear canal - so the speech is more than a little difficult to understand. Add to this the road noise from poor fitting earpieces, and our conversation was reduced to words of one sylabel, and handsigns.

5. I took a pair of noise protection ear plugs from work which DO make a good seal in my ears, and bore a hole through them with a hot wire. Using these to replace the supplied silicon rubber earpieces has cured the loose, uncomfortable fit problem, and almost lets me use VOX at highway speed (MotoGuzzi 850, partial fairing - pretty loud!) . We haven't yet tested the pair together with the modified earpieces yet (and its getting colder...)

6. There is considerable convenience in not having to unplug the helmet from the bike when getting off, not having a tail on the helmet at all (you can set it down and take steps away from it).

There you have it - the good, the bad, and the unknown!

73, bob

3154. Press release #5 from Albania via OH0XX

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-27 09:33:15 UTC
From: reisert@mast.enet.dec.com
Message-ID: <1991Sep27.153541.712@PA.dec.com>
Source record: 293135

PRESS RELEASE # 5 (Sept. 25th 1991)

NEWS FROM TIRANA:

Still with limited operating hours and two stations located at
the PTT building in downtown Tirana, the gang at ZA1A has been
able to complete 50 percent of their original contact target as
of today. 25,000 QSOs are in the logbooks after their first
seven days of activity.

As of today, most of the students are operational and you will
hear ZA1A activity with the following new operators at the
controls: Dalan, Geni, Jovan, Sadik, Dali, Gezim, Ylber,
Teodor, Niko, Lushi and Mirela (YL).

The training frequencies are:

SSB: 14.295, 21.395 and 28.695 kHz
CW: 14.075, 21.075 and 28.075 kHz

ZA1A has obtained more new operating priviledges, and you might
hear signals at:

1825, 1835, 1845, 3530, 3770 kHz (fixed)
7003, 7045, all WARC bands and VHF, UHF.

The ZA1A operation is truly authorized by Defense and PTT while
actual licencing is being delegated to the newly established
Albanian Amateur Radio Association with representation from
both authorizing agencies.

It is busy in Tirana <196> life is blooming for amateur radio,
while many other tasks still need to be completed for ZA land.

Regards,

The Gang at ZA1A

Long Delayed Echo (LDE) is another misunderstood term. On any given day, it isn't unusual to hear your own "echo" when propagation is favorable short path and long path at the same time. Terrestrial LDE is the convoluted propagation phenomenia that I referred to in my last comments. It delays the signal long enough that you can actually hear characters after you stop sending. Extra-terrestrial LDE is the big mystery. It suggests that your signal rattles around somewhere in space and then returns to Earth 5 to 10 seconds later. Good luck experimenting with this phenomina. If you want to hear your own echo, try E.M.E.
Hey, maybe if we hooked up enough Monster Cable, we could simulate an LDE!

Message-ID: <9109271417.AA15345@dinsdale.armstrong.edu>
Source record: 293138

Important to remember that the Blue Angels and the Thunderbirds are military flight teams. They can and do use any of the available aero frequencies for communication during their performances.

In my experience, you cannot rely on anyones "frequency list" nor can you rely on a frequency someone else (myself included) has previously encountered. I have successfully monitored both teams on each visit to the Savannah, GA area. Not once were they on any frequency "listed" for their use, nor were they on any frequency they had previously used in this area.

If you want to listen to them in action, you'll need to scan the VHF aero and (military) UHF aero bands during their rehearsal days (there are usually one or two days of practice at the airfield to be used prior to the performance). With a little luck you will find them.

Each time I did this, they remained on the same frequencies throughout their stay. BTW, if you take your scanner to the field, I recommend headphones for listening. If not, you will likely have a LARGE crowd around you listening in the action!

Source record: 293139

Well, I did rush out and picked up a pair of the RS TRC-500 VOX units at the sale price.

My impressions are as follows:

1. The audio quality is great.
2. The double conversion crystal controlled superhet receiver is impressive with an LM 386 AF output.
3. 5khz dev FM transmitter with VOX is really great.
4. The headset is fair, but a good idea anyway.
5. The range of only a few feet (maybe 50-100 feet) stinks.
6. The sale price fits the package of two units OK, but not at the regular price quoted.
7. Find a higher power transmitter to go with the receiver and then communications would improve immensely (anyone have a 49mhz power amp?)
8. Would like to see pots used instead of switches to control VOX and volume functions.

It appears the units would be suitable for a couple walking in a crowd and being able to communicate within sight of each other, but walk around a corner; WHERE DID YOU GO GEORGE?, -- GEORGE?

For motorcycle operation, the bikes would have to be not over a bike length apart for suitable operation. Yes, wind noise would trigger the VOX.

I'm wondering how the effective range of the units would work for tower-to-ground communication. At least the VOX idea leaves room for consideration.

3161. ICOM 2 SAT trouble (anyone had this problem?)

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-27 14:51:33 UTC
From: daford@watdragon.waterloo.edu
Message-ID: <1991Sep27.145133.10377@watdragon.waterloo.edu>
Source record: 293131

Dear Netland,

I purchased an ICOM-2SAT last November and have been quite happy with it.
Lately, however it seems to have developed an intermittent problem.

Over the past month, when turned on, the two LCD digits in the right corner of
the display that indicate the current frequency memory have become
intermittently corrupted. Instead of displaying a digit, the character "U" is
displayed. In addition, the unit ceases to receive; I have not yet determined
if it also ceases to transmit.

All other functions appear to work correctly, and the occurrence of this fault
does not appear to be correlated to any other aspect of operation
(e.g. current battery condition).

Anyone run into this problem or something similar?

Thanks

Dan

OK, here goes...Mostly from memory, a little from logic and folklore:

The origin of the "passengers' radios can interfere with navigation gear" stems back to the older avionics, when cheap transistor FM radios were just beginning to be popular, were not constructed real well, and tended to radiate quite nicely on the IF frequency, and, occasionally on the local oscillator (LO) frequency. At about the same time, precision instrument landing systems were becoming widely accepted, and the new VHF nav gear was coming into widespread use. The folklore claims that on "several" occasions, problems were noted with directional (not vertical) guidance, that could only be attributed to the use of the poorly shielded FM radios. Now, for those who were wondering, Take one FM station, with a broadcast frequency of, say, 100.5 MHz, and one cheap, imported transistor radio with an IF of 10.7 MHz. Mix together briskly, fail to filter, and you have heterodyne frequency products of 111.2 and89.8 MHz. 111.2 looks an awful lot like an ILS (localizer, horizontal guidance for precision landing system called an Instrument Landing System) to me. The proscription has been widely held, and probably shall continue to be since we gotta work through a bunch o' chair-warmers. Thee are some airlines, however, that have supposedly granted their captains the authority to allow passengers to use radios, etc. on the airplane without a mound of paper to the Company. American supposedly was one of 'em. Anyone know for sure?

Regarding the strong RF emissions screwing up aircraft avionics... The FAA and a variety of other certification agencies have initiated new cert. requirements for all new aircraft that require proof that flying through severe electromagnetic emmissions will not stop the engines, kill the avionics delete *.* the computers, etc. This particular requirement is supposed to have blown the Beech Starship back a full year, and required them to go through some real hoops to meet. It ain't just Canada requiring this, anymore.

Hope this helped. Flames to /dev/nul. Comments/questions via E-mail and I'll follow-up with summaries if warranted.

3164. Beacons on 20m

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-27 18:04:23 UTC
From: daford@watdragon.waterloo.edu
Message-ID: <1991Sep27.180423.19303@watdragon.waterloo.edu>
Source record: 293313

Anybody have a list of beacons on 20 meters (other bands as well)? I am interested in one group of beacons that are located around the world (I lost the frequency), I believe they cycle every 10 mins. or so.

Thanks

Dan

3165. Re: Daily Solar Geophysical Data Broadcast for 24 September

Newsgroup: rec.radio.amateur.misc

From: jeffj@seeker.MYSTIC.COM
Message-ID: <1118@seeker.MYSTIC.COM>
Source record: 293146

I have question about this report that I hope someone here could help me with. I understand the 10.7 flux, 90-AVG and SSN but what does the rest mean? I have a program called MiniProp that can use the flux number or the SSN number but is there other information there that can aid me in doing a propagation forcast? FLUXFCST=STD:184,187,195, is this a 3 day forcast? Thanks for any help here!

Jeff

I just plunked down $369 for a new Alinco DJ560T HT from HRO.
If anyone would be kind enough to mail me the mods for this
radio, I would appreciate it very much.

If I'm not mistaken this means that the PLL (phase lock loop) has become
unlocked. The PLL is a principle component in determining the frequency
of reception/transmission. You should not see this within the normal
2 meter band. If you are receiving outside this band (say fire or police
or weather), you may see this if the frequency entered is too far for
the PLL to reach (as compared to its normal working range).

If you see this within 2 meters the unit probably needs service.

>Doug - NO1D

I built one of those kits and it seesm to work just fine. Sensitivity isn't too
hot nor is its rejection of signals on the actual frequency the rcvr is tuned
to. But it was definitely a worthwhile project and I expect the sensitivity
issue could be helped if used a *real* antenna! :)

For those who really want to know what has been found about the use of radios, computers and other electronic devices in airplane cabins, and the extent of interference, there are reams of information related to studies of the subject by the Radio Technical Committee for Aeronautics. You can reach them at (202) 833-9339. Ask for copies of DO-156 and related documents. (I don't think they are free, though).

Those things were dual-purpose. One was, as you mentioned, the power
supply choke. While it was doing that, the combined plate/screen currents
through it made the assembly an electromagnet. A side advantage of that
was that it could be connected so as to act as a "hum-bucking" coil.
In those days it was not an easy to filter out 60- (or 120-) Hz hum.
Hooking these chokes up properly caused the resident hum in the B+ to
counteract the hum that was present in the signal to the voice coil.
Today's high-performance switching power supplies run at much higher
frequencies and so any "hum" would be a "whine"; but it is easier to
filter out with small capacitor values due to the higher frequency.

> Back in the late 50's we (college students) built the first DC (direct
>coupled) tube HI-FI amplifier, 16 6080's (I THINK) in parallel

Yes, the 6080 was the JAN version of the 6AS7; and I think it had a 24-volt
heater and carbon (or carbon-compound) plates to reduce secondary emission.
The normal use of this tube (a dual-triode) was as a series-pass tube in
voltage regulator circuits. Anyway, hats off to you for that experiment.

> I believe what your are referring to is the "cherry", a plastic film placed
> on faceplates to protect them from harm during the manufacturing process.
> Personally, I remove it first thing. Although it might look good
> for a while

I am not referring to a cherry nor do I mean pineapples or
raspberries. If you have ever seen an IC-24 you know what I mean. It
has a (removable) plastic cover in front of the actual display unit.
A Very Nice Idea, I thought, now one can replace the scratched display
(the cover, actually) with a part that costs next to nothing. That's
what I thought before I tried to obtain one..

By now I am rather confident that the part actually is available. But
I don't have any pointers as where to ask for it (if I can't get the
local dealer interested enough) except a phone number to Icom Service
in U. S. That's maybe too long a shot for me here in Finland, but I
will do that if necessary.

The question has raised some interest - I've got a bunch e-mail - but
I can't really help if I don't get the Icom part number. If someone
happens to know it, please e-mail or post it here!

> it still looks lousy if it gets torn.

It also looks lousy if scratched, broken or lost. In the latter two
cases, you are also bound to have two inoperable switches (Hi/Lo/DTMF
and Monitor in the European model) that the cover is supposed to hold
at their places.

Yes, I do regret buying the radio.

>or 20 dB. I believe a class A push-pull tube amp can do less than about
>1 percent distortion with no feedback, so not much feedback was needed.
>
>AL N1AL

I don't recall the exact figure either, but these numbers sound vaguely
familiar. When the Williamson circuit was introduced, there were many
claims of low distortion and flat frequency response. As I remember, some
were as low as .5 percent! This was with special output transformers with
screen taps, split-load phase inverters, and at least two different feedback
loops; one of which was taken, I believe, from the voice coil winding back to
the input stage.

Source record: 293140

Hi Steve,
I hope you got this letter from me, because this is the first time i had to reply to somebody and I'm still "New" on using this 6085, but anyways to the objective...
I used the Instructions on the "YAESU FT-470 Expanded Receive 430-500 MHz" that I picked-up at the local Ham Radio Outlet (You should be able to ask for the Mod. Sheet by asking for it at your local Ham Shop) when I purchased my Yaesu FT-470. It'll be better for you to do that than for me to put the whole thing all over again "on the air", because that Mod. has been floating around on this system for awhiles, earlier. But anyways, i noticed that after I performed this Keyboard Entry Mod., I was able to enter on the Lower limit channel (in Memory Tune (MT) mode and Lower limit channel already set to 108.025 Mhz), 140 Mhz. I did that by entering "40000"and it accepted the entry. I set the Standard Frequency Offset to 60 Khz and left the Repeater Offset to none or + and it TRANSMITTED. You can't use the - shift because it won't allow you to go below 140 Mhz. Well, after i discovered this new LOWER TX Limit, I tried this procedure again, but on the Upper Limit and found that I can enter up to 155 Mhz, and found I can TRANSMIT up to that New frequency Limit. It's just like programming in another frequency on 2 Meters, but one thing though...
I was curious about anther person's mention of "Extended Receive" capability by "HT OFF - HOLD up and down keys - turn on mod for extended receive.."- I tried it last evening and it RESET ALL MY MEMORIES AND NOW DOESN'T ALLOW me to perform the EXTENDED TRANSMIT capabilities ANYMORE. I was able to reprogram my 470 for the EXTENDED RECEIVE using another method, but that was it. If you had tried this "Mod." already, then I don't believe the "Extended Tx. will work for you either now. I'm still working on trying to get my 470 RESTORED back to original operation, but I'm not holding my breath...
Stay Tuned...

3176. Expanded Receive K.B. Entry Mod. to kronenpj@clutx.clarkson:edu:Xerox

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-28 04:16:26 UTC
From: Gogian_Yee.ES_GSD/WCO@xerox.COM
Message-ID: <"27-Sep-91.21:16:26.PDT".*.Gogian_Yee.ES_GSD.WCO@Xerox.com>
Source record: 293149

Hello Paul,
I thought I clarified myself when I stated that in order to use my discovery, that you must first use the "expanded Receive" Mod. sheet to "allow" your/my Yaesu FT-470 Handheld to utilize the "expanded Tx. from 140-155 Mhz), but I guess not. So here goes with what I was trying to avoid... Here's a "copy" of the "YAESU FT-470 EXPANDED RECEIVE 430-500 Mhz" instruction sheet...
YAESU FT-470
EXPANDED RECEIVE 430-500 MHZ.
This Modification will make the popular Yaesu FT-470 dual-band HT receive above 450 Mhz. Basically, this procedure stores the upper limit into the U memory. DO NOT OPEN THE RADIO. This is a keypad modification that will expand the receiver coverage to include 450-500 Mhz. Transmit and Receive will not be affected in the 430-450 MHz band. (VHF band is not effected). Special thanks to DARRELL SEGO (KM9S) for this Mod.
Modification info. PLEASE FOLLOW STEPS IN PROPER ORDER.
1. On the main band, program the frequency of 450.00 Mhz SIMPLEX.
2. Press the [F/M] and then the [RPT] button for offset.
3. Enter code 0000 into the keypad.
4. turn the radio off..... Now turn the radio back on.
5. Press the [RPT] key TWICE for a + (plus) offset.
6. Press the [REV] button one time.
7. The Radio should now display 1450 Mhz. (Note: The Radio will not work at these frequencies, but it should receive up to about 500 Mhz).
8. Now store the frequency of 500.00 Mhz in the U memory. Press the [F/M] key followed by the DOWN ARROW key to drop the frequency ONE Mhz at a time.
9. Store this frequency into MEMORY U. Press the [F/M] key and hold until you hear two beeps (the Beep must be ENABLED). Now rotate the top Channel/dial knob until the CHANNEL U is displayed. Press the [F/M] key again (you should hear a beep). This indicates that this upper channel is stored in the U MEMORY channel.
10. Now store 450.00 Mhz into MEMORY l for your lower limit (same way as you did in step 9).
11. To use the higher frequencies, you have to go to the U MEMORY AND PRESS THE [MR] BUTTON. This will put you in the MT (memory tune) mode. From there, you can scan down or use the Dial knob to select a lower freq.
12. Any selected freq. can be stored in a memory channel. HAVE FUN !!!
NOTE: If you are listening between 450-470 Mhz only. You may want to store 470.00 into the U memory for upper limit instead of 500 Mhz. Some Radios will not let you go up in frequency (only down). If you try to go UP, the rig will default back into the original ham band. Some Radios will let you go both up or down. GOOD LUCK !

N.M. 07/19/91

So paul, this is the SAME MOD. THAT WILL WORK ON THE 2 METER BAND ALSO !!! Just use the same application on that band.
AFTER you perform the Mod. above, you should be able to "program" in the 140 Mhz to 155 Mhz frequencies (Hopefully) once you "expanded your Lower and Upper limits on both your bands to your desire.
I had set my 2 Meter Band limits to 108.025 Mhz and 204.295 Mhz respectively.
My 70 cm Band limits are 300.00 Mhz and 510.000 Mhz, respectively.
That's how you (and I can) Enter 140 to 155 Mhz on the 2 Meter side without having the radio reject it or start all over.
HOPE this makes sense to you now Paul.

>With a little luck you will find them.

What is a good scan range to find military air frequencies? With the
UHF aero band being so large (225-400 MHz) it is difficult to scan and
find frequencies. I find that most of my UHF aero monitoring is from
frequency listings or aeronautical sectionals.

thanks for any info,

Steve Kuo, N8OPH, sdkuo@oakland.edu

That beacon is a "feature" of that part of 75 meters. My friend K1ANX and I park just above it every Sunday evening for our weekly sked. It's a good indicator of propagation conditons accross the Atlantic and frankly, a semi-indicator to me of how well George and I are going to hear each other.

How's that you say? Well, when you hear certain stations hundreds of times (literally), how they sound kinda gets integrated with other info into being a meaningful indicator of progagation conditions.

Like if I have trouble hearing WA2TEW on the 3905 Century Club on either 40 or 80 meters. Then I know for sure there has be something like a tremendous solar flare....and to expect to hear certain other station to propagate much better than they do on average (like the ones consistently hard to hear out of NM or OR or WA or AZ).

The packaging doesn't protect the devices against static discharge. That's
almost certainly what got yours. Surprisingly high static voltages can
build up on an antenna when the air is dry. Unsurprisingly high voltages
can be induced during a nearby storm. One or the other probably got you.

$25 sounds fair for shop labor, but you can do it yourself for free if
you have a fine tipped temperature controlled iron and some solder wick.
Or if you have a blowtorch and good technique, that's how I remove SMDs.
The Hamtronics preamp is only so so and you can make your own schematic
for your unit, just follow the traces around. Hamtronics makes a *great*
ham preamp using helical filters, but the wideband unit overloads easily.

The FT470 is wired like an Icom. You connect the audio from the TNC to the tip of the mike plug through a capacitor and connect the PTT to the tip with a resistor. The Icoms and Yaesus use a "leaky ground" to generate PTT. The problem with this approach is there is a tradeoff between rapid PTT and audio level and response. Typical values are .1 ufd and 2.2 k ohms. The RC time constant limits TR turnaround.

A better scheme is to use a tiny audio transformer sideways like so,

```
TNC PTT----------))))))))))))------------> radio tip (audio)
============
TNC AF OUT-------))))))))))))----X--------> radio sleeve (gnd)
|
TNC GND--------------------------|
```

You can rip a suitable transformer out of an old transistor radio or buy one from Radio Shack.

>don't see anything except a mysterious looking rubber plug-which-might-
>hide-a-jack-but-I'm-afraid-to-pull-it-and-look. The manual, again,
>says nothing about this.

The 2 meter only model does have a power jack under the rubber plug, but the 470 doesn't. There's a place on the board for one, but Yaesu recomends that you use a PA-6 module instead. This is a module that mounts in place of the battery and contains regulators for running the radio and charging a battery connected to the bottom of the PA-6. This is a really nice accessory and well worth the price.

>3. Anything else (useful modifications, hints, caveats) I should know
>about the FT-470 (or PK-88?)

Just the standard remarks that you should carefully set the audio level so you wind up with a 3 khz deviation for your tones. Don't exceed that level or many units will have trouble decoding your packets. Make sure you have the power saver on the 470 turned off when you run packet or you'll miss the first part of every packet. This can drive you nuts because everything seems to be working but nothing prints.

One last note. Use a separate antenna and use shielded cables on your TNC. Otherwise the RFI and RF feedback will ruin your packet operation.

3182. Plans for small transmitter/receiver

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-28 14:36:47 UTC
From: ah157@cleveland.Freenet.Edu
Message-ID: <1991Sep28.143647.1128@usenet.ins.cwru.edu>
Source record: 293153

I am an electronics enthusiast and was
wondering if anyone out there has
plans for a small do it yourself
AM band or even ham band transmitter.
I'm not a pirate and am not going to
override stations,i just want to have
something to toy around with.
I'm also planning to get a license in
the next few weeks so don't worry about
that either.
I just need about a 3 block
range with this thing,so i can talk
to my friends all at once.
Leave mail please.

3183. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-28 15:52:09 UTC
From: tkelso@galaxy.afit.af.mil
Message-ID: <tkelso.686073129@galaxy.afit.af.mil>
Source record: 293155

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space and rec.radio.amateur.misc. This week's elements are provided below.

3184. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-28 15:53:03 UTC
From: tkelso@galaxy.afit.af.mil
Message-ID: <tkelso.686073183@galaxy.afit.af.mil>
Source record: 293151
Cross-posted to: sci.space,rec.radio.amateur.misc

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space and rec.radio.amateur.misc on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a eleven-character name.

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

3185. Want Very Cheap Anti-Shoplifting System - Sort of

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-28 16:57:39 UTC
From: harold@terminus.gatech.edu
Message-ID: <2269@mephisto.gatech.edu>
Source record: 293158

My wife teaches special education. She currently has a pupil who wanders out of the classroom occasionally. She can't just tie a leash to him, and she doesn't want to keep all the doors closed all the time and she doesn't want an alarm to go off whenever anybody enter/leaves the room. She DOES want to know as soon as this child attemps to leave the room.

My idea was to use something like the anti-shoplifting system they have in clothing stores. A tag that is attached to the clothes. Detectors at the doors activate a alarm if a tag goes through the doorway.

Does anyone know if this can be done, and how, for say $100?

Thanks.
harold

3186. **-- SOMEONE PLEASE SEND DX-440 TAPE-OUT MOD --**

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-28 17:52:00 UTC
From: padawer@utkvx2.utk.edu
Message-ID: <28SEP199113520693@utkvx2.utk.edu>
Source record: 293160
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc

I realize this is a perennial request, but I'm one of the uninitiated. Would someone please be so kind as to send or post the tape-out modification for the Radio Shack DX-440 (which restores the taping capabilities of the set to that found in the sister radio, the Sangean ATS-803A).

I'd also like to see the pin-out for the stock Sangean ATS-803A taping DIN plug.

Thanks.

Randy Padawer

SpaceNews
=========

MONDAY SEPTEMBER 30, 1991

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* PACSAT NEWS *
===============
DOVE has been silent on 2-meters as command station N4HY prepares the
spacecraft to accept speech software. When DOVE returns to 2-meters,
it is expected to be sending voice messages in addition to telemetry
packets.

The status of some of the other MicroSats are given below. These are
packet frames actually received from the satellite listed:

===

From AMSAT-OSCAR-16:

PACSAT-1>AMSAT <UI>:

09/26/91 0326Z: Experimenters day over for this week.

* U5MIR NEWS *
==============
Sergei, U5MIR, was active last weekend making several voice contacts
with ground stations. During one of his contacts, he expressed an
interest in contacting the next U.S. ham in space, currently scheduled
for May 1992.

* SATELLITE OF THE WEEK *
========================
The "Satellite Of The Week" feature is in response to numerous requests
for amateur satellite transponder passband and beacon frequency information.
All active amateur satellites will be covered in upcoming weeks.

Name : RS10/RS11, NASA Catalog Number: 18129, Launched on 23-Jun-87
Orbit : Low-altitude, circular

RS10/RS11 are two amateur radio transponder packages attached to COSMOS
1861. Each transponder is identical, although the frequencies each uses
are different.

RS-10 Frequency Chart

Uplink Passband Downlink Passband

Mode K 21.160- 21.200 MHz 29.360- 29.400 MHz
Mode T 21.160- 21.200 MHz 145.860-145.900 MHz
Mode A 145.860-145.900 MHz 29.360- 29.400 MHz

Mode KT = Mode K or T uplink with BOTH K and T downlinks.
Mode KA = BOTH Mode K and A uplinks into a common Mode K or A downlink.

CW Beacon Frequencies: 29.357, 29.403, 145.857, 145.903 MHz
Autotransponder ("robot") uplinks: 21.120 and 145.820 MHz

RS-11 Frequency Chart

Uplink Passband Downlink Passband

Mode K 21.210- 21.250 MHz 29.410- 29.450 MHz
Mode T 21.210- 21.250 MHz 145.910-145.950 MHz
Mode A 145.910-145.950 MHz 29.410- 29.450 MHz

Mode KT = Mode K or T uplink with BOTH K and T downlinks.
Mode KA = BOTH Mode K and A uplinks into a common Mode K or A downlink.

CW Beacon Frequencies: 29.407, 29.453, 145.907, 145.830 MHz
Autotransponder ("robot") uplinks: 21.130 and 145.830 MHz

"Robot" operation involves sending "RS10 DE (your callsign) AR" using
Morse telegraphy between 10 and 40 WPM. Successful contact with the
autotransponder will yield a QSO number.

3188. 2m Equipment For Sale

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-28 23:21:00 UTC
From: JPB7946%TNTECH.BITNET@cunyvm.cuny.edu
Message-ID: <01GB4I5TNGDCDRPDNV@TNTECH.BITNET>
Source record: 293161

After several responses to my price inquiry (thanks to those who helped me out), I offer the following equipment for sale:

FOR SALE:

Icom IC-2AT 2m HT ("the brick") all original manuals, including schematic
Icom HM-46 Mini-Speaker Mic light weight, easy to use
Icom DC-1 DC Converter for use with CP-1, or 12V power supply
Icom CP-1 Cigarette Charger use to charge battery, or power radio while using DC-1
Largo Kulduckie 2m rubber duck antenna "gold" bnc connector

All equipment is in excellent working and appearance order.

PRICE: $175 + shipping (or best offer)

Please send BITNET MAIL if you have any questions or if you would like to make an offer.

73,
Jon / N4VRN
JPB7946@TNTECH.BITNET

3191. Amateurs on USENET List

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-29 06:18:23 UTC
From: mark@ve6mgs.uucp
Message-ID: <1991Sep29.061823.17740@ve6mgs.uucp>
Source record: 293163
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet

I operate a gateway for USENET articles to the local Packet Bulletin Boards.
A side effect is that I am building a list of the amateurs on the Network. As
promised earlier, here is the list I've maintained. I would be pleased to take
any e-mail updates to this list.
Enjoy, 73 de VE6MGS/Mark -sk-
---------------------------It's been a slice-----------------------------------
Network address to name or call letters lookup table
#
Entries have this format:
Address Call Name
#
Address Network address popularily used by individuals on the network.
Call Call letters of the individual.
Name Name of the individual. A trailing * denotes not searched in
call book for verification yet, @ means not found in call book.
? after name means recheck (Call does not match name or other
discrepancy) may be required. If there are none of these, then
the address/call and name have been confirmed in the
callbook (1987).

The current issue of Popular Electronics has one on the cover - an old style AM wireless phono ....about 20 bucks....

From: genius@saviour.UUCP
Message-ID: <yNw297w164w@saviour.UUCP>
Source record: 293176

Hello,
I have seen that heath kit makes a radio that receives signals from WWV
and decodes thoses signals into the current time. So in effect, you get
a really really accurate clock. Does anyone know more about this signal
sent out by WWV. What is its protocol. Where is it located within the
signal. Please post anyting you may know about this subject or send
me E-Mail.
THX,
Bill.

3194. RACES Bulletin #189

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-29 17:15:58 UTC
From: enge@almaden.ibm.com
Message-ID: <9109301537.AA00290@ucsd.edu>
Source record: 293086

From : W6HIR @ WA6NWE.#NOCAL.CA.USA
To : RACES @ ALLUS
Msgid : $RACESBUL.189

TO: ALL EMERGENCY MANAGEMENT AGENCIES/OFFICES VIA THE ARS
INFO: ALL RACES OPERATORS IN CA (ALLCA: OFFICIAL)
ALL AMATEURS U.S. (@ USA: INFORMATION)
FROM: CA STATE OFFICE OF EMERGENCY SERVICES (W6HIR @ WA6NWE.CA)
2800 Meadowview Rd., Sacramento, CA 95832 (916)427-4281
RACESBUL.189 DATE: September 30, 1991
SUBJECT: DRILL AND EXERCISE REALITY, PART 2/3

By April Moell, WA6OPS, Anaheim

(Continued)
5. We may have no control over the starting or ending time of the drills. We will give you our best approximations. Sometimes there are problems setting up the disaster scene and the drill starts late. That means the hams will get called late.If you've been pre-staged we will try to keep you advised over the air. Sometimes there are difficulties retrieving all the victims or resources after the drill. You may be asked to stay at your post past the end of the drill. If this causes you a problem, let your supervisor know ahead of time. If there are staggered callouts or activations of radio volunteers, please DON'T GET ON THE AIR AND ASK when you are going to be called. Be patient.
6. If you said you can be available for a drill date, WE ARE PLANNING ON USING YOU. PLEASE TAKE THE COMMITMENT SERIOUSLY. It takes a lot of time and phone bills to contact people, assign them, and contact them again with their assignments. Thinking we won't miss just one volunteer is erroneous. If several people think that we will be in trouble, and it isn't just a matter of plugging someone in. One dropout can create a domino effect, causing shuffling of operators to provide the proper coverage and support new ones in the drill. That means more phone calls and chaos.
7. Hospital (and government) people aren't fond of drills. They disrupt their normal routine. They are required to do them. They don't want to be embarrassed by doing something wrong. When the drill is over, you will likely see a very rapid disappearance of personnel. If victims are yet to be picked up for transport back to the site and you are a possible communications link for that, don't let the command post close up without knowing who your contact is going to be. The hospital is supposed to have someone in charge of the victims. Don't let them abandon you.

It is not your job to keep track of the victims.
(To be concluded in the next Bulletin)
EOM

Can someone tell me what the address of the station that has
the callbook online. I remembre doing it a few months ago,
but lost the info, Thanks, Mike

3196. Re: Standard Radio C228a HT

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-29 17:54:45 UTC
From: stigall@bronze.ucs.indiana.edu
Message-ID: <1991Sep29.175445.8672@bronze.ucs.indiana.edu>
Source record: 293167

I have the C500 Standard and really like it. It's the one that Heath sold on clearance, 2M/440 with an extra band 340-400 thrown in. It doesn't have DTMF paging or auto-dial, but it was cheap and works well. I've had it apart and it it is well made inside. I have dropped it at least 3 times with no damage. I can't wait to use it for full-duplex phone patch.

From: alanb@hpnmdla.sr.hp.com
Message-ID: <14570177@hpnmdla.sr.hp.com>
Source record: 293171

In rec.radio.amateur.misc, zbang@access.digex.com (Carl P. Zwanzig) writes:

>FYI the "normal" telephone subscriber loop is 900 ohm nominal, not 600.

Don't telephone company AC voltmeters have their "dB" scale calibrated
to 600 ohms? I thought this was because the phone system was nominally
600 ohm impedance.

Oh, well, I could be wrong. It happened once before :=)

3198. Major Solar Flare Alert - Minor Impact Possible - 29 Sept.

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-29 18:18:11 UTC
From: oler@hg.uleth.CA
Message-ID: <0094F5DF.0EE6DCA0.7653@hg.uleth.ca>
Source record: 293168

/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\

MAJOR SOLAR FLARE ALERT

ISSUED: 18:00 UT, 29 SEPT

/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\

Low - Moderate Impact Possible

MAJOR ENERGETIC EVENT SUMMARY:

Flare Size: Class M7.3/2N Location: S21E30 (Region 6853)
Tenflare: ~660 sfu @ 1513-1606UT Times: Begin=1512, Peak=1533, End=1642

Sweeps: Type IV (Importance 3) at 1523 UT. Duration: 15 minutes.
No Type II observed.

NOTES: This event was a long-decay event (LDE). Xrays are still continuing
to fall, but are well into the C-class level now. A moderate SWF
appears to have been associated (preliminary). A Major Type IV sweep
was observed, but was fairly brief in duration (15 minutes).

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT:

This major flare could have a minor (low to moderate) terrestrial
impact. This particular event is a difficult one to forecast. It is a
"greyline" case in many areas. We will likely forecast enhanced geomagnetic
and auroral conditions for either late in the UT day of 01 October or
sometime in the UT day of 02 October (early to mid part of the day). This
event could produce activity ranging from mostly active conditions to
possible minor storm levels. We would expect most of the activity to be
within the active to possible minor storm levels if an impact materializes.

There is also a very slight risk for the arrival of protons from this
event. So far, no protons have been observed and likely will not be observed
for several hours, if at all. The probability is not particularly high with
this event, although it is slightly possible.

If protons do arrive, polar path radio communications may be disrupted.
Communications over these areas is still fairly poor as a result of the
recent geomagnetic storming. Although a PCA event is unlikely to be
observed, polar path communicators or users of the OMEGA navigation beacons
should be aware of the increased risk for proton related anomalies associated
with possible future major energetic solar events.

1 IRC still has a value which is less than surface mail postage in
India - at least, till July 1991, when I was there.
1 IRC brings between 100 and 200 fils, depending on the post office, in
A92, Bahrain. That is, IF it is accepted at all, which is very rare. I
had a pretty large bunch of IRCs when I left Bahrain this May, because
after my post office exchanged the first ten IRCs, they refused to take
any more!
Postage to the US is 205 fils/10 gms. 1000 fils is 1 Bah.Dinar. 1 BD
is $2.65. So 1 IRC is still not enough.
I think most DX prefer S1.00. I did!

3201. Sony GPS receiver "discman"...

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-30 00:40:19 UTC
From: William=E.=Newkirk%Pubs%GenAv.Mlb@BANYAN9.CAcd.CR.rockwell.COM
Message-ID: <9109292339.AA08537@ucsd.edu>
Source record: 293175

(WB4ROX follows the GPS world pretty closely...forwarded him some excerpts of the Sony GPS comments seen here earlier...here's his reply ... wb9ivr)

I saw a prototype of the Sony GPS unit at Oshkosh a couple of months ago. It does indeed look like a "diskman". In fact it doesn't look like something you'd want to risk using outdoors (not very rugged). They should have made it like a "sports" Walkman (yellow/rugged/waterproof). Where do they think people are going to use it, in the living room?

The prototype used a patch (flat) antenna on a weighted mount to keep it horizontal. I can just imagine using it in a jeep, antenna swinging madly. Patch antennas are nice and flat, but the coverage near the horizon is marginal, hence their sensitivity to being held horizontal. The best position fixes are using satellites that are low on the horizon, exactly in the patch antenna's weak spot. Post antennas perform much better, but people don't like the fat, short, "rubber ducky" or stub sticking out.

I don't know how well the Sony unit performs. I think it's a six channel unit. It should perform well, except for the above antenna and packaging gripes. We'll begin to see many more "consumer" receivers soon.

3202. Correction to Major Flare Alert - Optical 4B event, not a 2N !

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-30 00:59:23 UTC
From: oler@hg.uleth.CA
Message-ID: <0094F617.1AA9E680.8021@hg.uleth.ca>
Source record: 293173

CORRECTION TO PREVIOUS MAJOR FLARE ALERT

A correction is in order regarding the last Major Solar Flare Alert which was issued earlier today.

The flare given in that report was rated a class M7.3/2N event. In actuality, this event was a much larger optical event, rated a 4B event, not a 2N as reported earlier. This is the top of the scale for optical flares in size and brightness.

Simultaneous brightenings were observed in nearby Region 6850 during this large energetic flare. The potential terrestrial impact is still rated as low to possibly moderate (active to possibly minor storm conditions) late on 01 October or during the early to mid part of the UT day on 02 October. Recent filament disappearances as well as a well placed coronal hole are expected to contribute to the activity from 30 September to 02 or 03 October.

No protons have been observed from this major flare.

3203. Budelman Electronics 900 Mhz Amplifier Info wanted

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-30 01:24:54 UTC
From: w1gsl@athena.mit.edu
Message-ID: <1991Sep30.012454.29795@athena.mit.edu>
Source record: 293172

At a recent flea I picked up a 2c39 amp that looks like it should work on
902, but ofcourse there are no docs. :-(

It was made by Budelman Electronics Corp
Stamford Conn USA

anyone ever hear of them? Dir assistance has no such company, nor do I find
any listing in the current trade directories.

The lables says it is a type 108B covering 840 - 960 MHz.

The beast looks almost but not quite military, mabey made about 1960?

It is just one 2C39 in a cavity and looks simple enough, but I can't seem
to get the high voltage to come up, a schematic to debug the 3 relay interlock
circuit would be nice :-)

Thanks in advance for any help.

3204. CALLSIGN PROJECT PART 4

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-30 01:41:43 UTC
From: beers@sybil.cs.Buffalo.EDU
Message-ID: <1991Sep30.014143.9783@acsu.buffalo.edu>
Source record: 293174

```
CALLSIGN PROJECT PART 4
-----------------------

The UB Amateur Radio Club will be taking over the wonderful service
provided by Rusty Carruth N7IKQ for the past few years.

This is how it works: Those people interested in obtaining a copy of the
US Callsign Database on tape can send us a donation. When enough people have
done so (enough to cover the cost of the tape), we will begin making copies
and sending them out to you. The following types of media and file formats
will be supported:

Media: 9 track tape
1/4" Sun cartridge
8mm tape
floppy disk (1.44MByte 3.5")
Formats: compressed/uncompressed tar
raw data (cat > /device),
compressed raw data (cat | compress > /device)
arc (not standard UNIX, but handy for those PC users out there.
We have version 5.21)
cpio (if you really, really, really, can't do tar...)

The tape contains one entry for every ham in the US, not including club
stations.

The cost will be as in years past: $25 plus media and shipping. I
expect the tape should be in by the middle of December, so we will begin
making copies over our Christmas break, and you should start receiving them
after the 1st of the year.

Please send e-mail to one of the addresses below if you are interested in
the database.

beers@cs.buffalo.edu

>organize it or anything. Anyone else?
>
>Devon

Well, Andrew Beers (beers@cs.buffalo.edu) is involved in a club which has decided to take over the callsign project. (What a relief! ;-)

So, the callsign project lives on, and "Part 4" begins.. well, I'm going to do the ordering and conversion to the 3 or 4 formats I make and then ship them off to Andrew, so I'm ordering the tape this week. (Those of you involved in this last year know how LONG it takes the NTIS to do anything... maybe around Christmas I'll get the tape...)

I expect Andrew to pipe up here real soon now and announce how they plan to run things. (and thats all I'll say about THAT :-)

I'm sure I'm forgetting something really important... Oh, well, I'll repost when I remember. For now:

73 and "Live long and [may the callsign project] prosper" :-) :-) :-)

(come on, give me a break, its Sunday night and I've just been watching the 25 year Star Trek special :-)

3207. Monitoring UHF military aero band

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-30 04:24:44 UTC
From: sdkuo@argo.acs.oakland.edu
Message-ID: <10257@vela.acs.oakland.edu>
Source record: 293078

What is a good method of obtaining UHF aero frequencies to monitor?
I have a PRO2004 scanner so it is possible to scan a range of frequencies.
The problem is that the UHF aero band is so large (225-400 MHz) that it
is difficult to scan. Could anyone give me some help as to how to find
military air frequencies (or give me frequencies).

thanks,

Steve Kuo, N8OPH, sdkuo@oakland.edu

Last time I measured, the carbon mic was in the neighborhood of 180 ohms. Why not ask on comp.dcom.telecom, along with the reason why you need to know... Several AT&T folks hang out there, plus several hams who do telecom for a living. All nice folks that don;t mind sharing info.

Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave

Hi rec.radio readers

I've just acquired a number of hand-held transceivers but unfortunately have no technical data to go with them. They are Johnson FM588 walkie-talkies, made by E.F.Johnson Company (I think in Minnesota). All the crystals have been removed so I don't know how the UHF frequencies (around 453MHz) were derived. I hope to recrystal and tune them up for the 430-440MHz band. Any technical information would be much appreciated.

Thanks & 73

> with an LM 386 AF output.
>3. 5khz dev FM transmitter with VOX is really great.
>5. The range of only a few feet (maybe 50-100 feet) stinks.

A friend bought two and had his brother who works at a 2-way shop retune
the transmitters. Apparently Maxon (who makes the beasts) can't tune a
radio properly, as the units now have much better range - the power was
low and they were not on (the same) frequency.

>7. Find a higher power transmitter to go with the receiver and then
> communications would improve immensely (anyone have a 49mhz power amp?)

May not be necessary -

>8. Would like to see pots used instead of switches to control VOX and volume
> functions.

Easy enough mod. Probably could be done and still look stock.

What I'd like to do with mine is have the mic control the receiver
volume when in receive mode. If the local noise level went up, so would
the volume....

Jack-in-the-Box drive-through restaurants used to do this back in the
'70s (it would measure the engine volume as you drove up, and a loud
truck vs a quiet car made a very noticeable difference). The current
sound systems don't have this feature any more.... Why not?

Source record: 293083

/\

SOLAR TERRESTRIAL BULLETIN

ISSUED: 09:00 UT, 30 Sept.

WARNING - PROTONS ARE ENHANCED

/\

WARNING - PROTON LEVELS ARE ENHANCED

An enhancement in 10 MeV protons is being observed at the present time. Although the probability is not particularly high, there is a risk that protons may reach event thresholds of 10 pfu over the next 24 hours. The suspected source of this enhancement is the large class M7.3/4B tenflare which erupted from Region 6853 earlier today.

Protons should return to near background levels within the next 48 to 72 hours, barring further major energetic solar events. Users of the OMEGA navigation signals should be aware of the increased risk for errors on polar paths. HF communicators are alerted to the potential for weak PCA activity on polar paths possibly accompanying this proton enhancement. At the present time, protons are not expected to rise to sufficient levels to generate a PCA event. However, a slight risk does exist and will continue to exist as long as Regions 6853 and 6850 remain in view. Further major energetic solar flares could generate stronger proton and PCA levels over the next week.

** End of Bulletin **

I believe Motorola took over TRW's RF power transistor business.

My current Motorola data book has quite a number of PT prefix devices, but not that one, sorry. Vol II carries the old TRW apps notes as well as the H O Granberg designs.

Ask Motorola, they should be able to help.

[remainder deleted]

A Japanese coworker told me awhile ago that by the time repeaters came to Japanese Amateur Radio, the 2-meter band was so fully occupied that there was no way to shoehorn them in. I don't know whether this translated to codification of this situation in the Japanese Amateur Radio rules; practically, though, 2-meter repeaters were all but impossible because of band occupancy.

As a result of such spectrum loading, Japanese utilization of VHF/UHF is a band or two ahead of ours, and much heavier. For example, dual band 440/*1200*-MHz hand-helds are very popular in Japan; the 1200-MHz band is very heavily loaded there. They don't have 222- and 902-MHz ham bands there, either.

Other musical works with morse-embedded:

'Radio-activity' by Kraftwerk, contains all sorts of CW. Some of it being tuned through, so the tone goes from high to low then back to high (audio image? they need a decent set of filters!).

RADIO K.A.O.S. (John Waters) has a load of morse in places.

Finally, I am told that the theme tune for the 'Inspector Morse' TV detective series (which you Statesiders may not have bought off us brits yet) is actually based on the rhythm of the morse for the letters M O R S E. This was told to me by someone who studies music!

Finally-finally, some of the works of Isao Tomita (a mid-70's vintage Japanese electronic music composer) have what sound suspiciously like packet in certain places... i tried feeding them into my TNC but got nothing; the 'braaaap!' sure sounds kinda familiar though...!

Maybe someone out there is trying mind-altering experiments on the population by bombarding us with subliminal CW??

3220. Antenna switching mechanisms

Newsgroup: rec.radio.amateur.misc

<>

I have a problem for which I am not sure of a good solution. I have five receivers in my listening post. (No transmitters, as I am only an SWL at this point). Due to restrictive covenants, I have only one really decent antenna, and several poor ones. I would like a way to switch my antennas so that I can "rotate" the receivers among the various antennas. In other words, all receivers will be connected to antennas at all times, but I want to be able to switch which antenna is connected to which receiver. I cannot seem to find an antenna switch that would allow me to rotate antennas in this fashion.

The only thing I have found is to put two 1-5 antenna switches back to back. This would allow me to connect any antenna to any receiver, but the drawback is that only one receiver would have an antenna connected to it at any one time. This is NOT what I want; I want all receivers connected to an antenna, but I want to be able to rotate which receivers are connected to a given antenna, with each antenna connected to one and only one receiver.

I don't want to use any sort of distribution amplifier as I do not want to degrade reception...I want a simple switching mechanism only, that is suitable for RF applications.

Anyone have this problem? If so, how did you solve it? Does anyone else have any ideas on how to solve this problem?

3221. Find original holder of my call?

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-30 15:44:08 UTC
From: bert@s5000.RSVL.UNISYS.COM
Message-ID: <9109301044.AA01055@s5000.RSVL.UNISYS.COM>
Source record: 293088

I'm now on my third call in 30 years and I'm sure that the last two must have
been owned by someone before me. Is there any (easy) way to satisfy my IDLE
curiosity about this?
Just in case somebody has 75 years worth of callbooks at hand, the calls are:
W0RSB (my current call) which I got in 1977 and
W2HIR which I got in 1973.
My original call, of which I was the first (and, so far, only) owner was K3OCN
which I got in 1961.

Like I said, this is idle curiosity, so don't anybody work too hard (if at all)
on this one.

3222. High speed packet ?

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-30 17:17:23 UTC
From: az@i5120h.nrl.navy.MIL
Message-ID: <9109301717.AA04491@i5120h.nrl.navy.mil>
Source record: 293091

Good Day,

I'm wondering if anyone can direct me towards information regarding the latest technology regarding high speed packet networks. Who in the ham community, or otherwise, is running >2400 bps, over frequencies >50 MHz, over 'real' distances, .ie >line-of-sight ?
I have heard, in the past, that there has been some 4800-9600 bps activity on 6m out west and rumors that there are some trying the same at 900 MHz, using straight FM/AFSK techniques. I've also heard of some trying to use 9600 bps FAX modems over FM boxes, as well. I'm aware that some are also running 9600 bps (PSK) to several of the low orbitting satellites too.
I would really appreciate "details" regarding any, or all of the above (modes freq, rates success/failures). Where do these people/groups hang out? Internet addresses, BBS's, PBBS's, newsletters, company names would be a start..anything to push me into the right circles would be great!

Please respond direct and thanks for your time.

andy (ka1gd) 202-767-2493

I have been following this thread fairly closely over the last few months, and I have heard a lot of talk about writing Congress about this bill. This is well and good.

I have yet to hear anyone, however, (ARRL members or other) suggest we lobby the ARRL to change their position on the matter. Have I missed something? The ARRL is fully able to lobby Congress on behalf of a particular issue of concern to hams and radio enthusiasts alike. I know that the ARRL is a ham organization and that this bill goes beyond ham radio, but it seems to me if enough hams (members or not) wrote them and voiced dissatisfaction with their position on this bill, we MIGHT stand a chance of bringing a lot more fire to bear on this issue.

That's my $.02 worth.

A friend bought a pair of these for coordinating two
workers diagnosing broken wiring and immediately noted
the poor range. A quick examination of the circuit
revealed that RS had installed resistors of too high
a value in the collector of the RF final amp. If I recall
the schematic called for about 120 ohms, and the units
had 1200 ohm resistors installed, reducing power out
by a very large amount. A few moments with a soldering
pencil solved the problem, and the range increased
dramatically. The resistor values are from memory,
which is not reliable, but I do recall that the units
worked fine after the schematic diagram was followed.

From: rja@batcomfs.Eng.Sun.COM
Message-ID: <20698@exodus.Eng.Sun.COM>
Source record: 293096

After shopping around for a base-station reciver to
complement my R1 handheld. I'm looking for something
which covers VHF on up, figuring I'll have to buy a
seperate HF scanner.

I've come to the conclusion that the R7000 is the only
box (in that price range) which fulfills my requirements.
However, I played with on this weekend, and I think it
has a few user-interface problems. I've also heard that
a new model will come out to replace it soon. I'd like
any information on the new one, but am particularly
interested in (obviously) things like release date, price,
freq range, etc.

BTW, has anyone used an R100? It seemed like a nice mobile
scanner, and even a decent home scanner, although the user
interface was somewhat obscure.

3228. QRP HF operation

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-30 20:42:42 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <9109301342.aa22712@PARIS.ICS.UCI.EDU>
Source record: 293098

Greetings all:

I recently picked up an old Ten Tec Argonaut 509 80-10 meters (analog)
with up to 5 watts output SSB and CW. I live on campus, but next to
the ocean (by a few miles), and set up a loose (mostly hidden) dipole
with 20 lb test fishing line and 24 guage single strand insulated wire.

Well, the darned thing is WORKING, VERY WELL. I swear that if someone
told me I was running a 100 watt rig, I would NOT be disappointed with
the performance. I am amazed. Truly amazed. It is NOT that I have never
operated QRP before, I belong to QRP ARCI since 1974 and used an
Argonaut 505 back then, but generally KNEW I was running less signal
than most others on the band. That is not true of my current setup.
I think there is some unexplainable magic in my antenna installation
(a really good ground, reasonable positioning, etc) that does just enough
extra for my signal, that I am generally able to "compete" with the
many 100 watt stations nearby - even for DX.

Anyway, my amazement aside, I wonder if anyone else out there is really sold
on QRP operation (I know that not all locations or operating styles mix
well with QRP). I do not have any other options in my shack by choice.
I am looking for other QRP (especially SSB) operators out there who would
like to converse on the topic. I'd be really happy to meet any QRPers
in my local area.

I am generally checked in to the HHH net on 7235 kHz each night hunting
DX and looking for Utah and Wyoming for my WAS QRP on the net. The net
really enjoys QRP operators. It meets at 0700 Z (midnight pacific).
I also frequent the 3905 Century Club Net on 7233 kHz between 0400 Z and
up until the HHH net.

That's why I have a case for the radio. I have had cases for every HT I have owned. Cases keep them from getting scratched (which is inevitable, unless you use the case, or keep the thing in its box an never use it).

I have never had a problem selling any HT, because they are in such great condition since I use cases.

PRESS RELEASE # 6 (30 SEPT 1991)

NEWS FROM TIRANA

More than 40.000 QSOs were in the books on Saturday, when the gang at ZA1A was proceeding to their last week in Albania. All the equipment is functioning well and the training course is right on it's agenda.

Another operating site was established at the sea coast in Durres - some 20 miles from Tirana - and signals can be heard from the very same location where OH2BH/ZA was active some 20 years ago.

Other activities were added:

Six meter activity was started last week.

Mr. Luciano Fusari, I5FLN will arrive on October 3rd, to introduce and operate RTTY from Albania for the first time ever. The activity will last four (4) days on 3585, 7035, 14085, 21085 and 28085 kHz... QSX some 10 kHz up.

Four students were licensed and you can now hear ZA1TAA, ZA1TAB, ZA1TAC and ZA1TAD on the bands. More permissions will be granted upon the exam later this week.

Albania is not a rare country any more - we have Albanians now with us in this wonderfull hobby. The cycle is now completed - but the Deserving are already asking "Where Do We Go Next?".

Best regards from Tirana

Martti Laine, OH2BH
Project coordinator

Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave,misc.wanted

I am looking for a SHORTWAVE CONVERTER...one of those wonderful
little things that attach to an automobile AM radio and allow
limited shortwave listening. There have been a few manufactured
over the years, the latest being the MFJ-304 and MFJ-308, both
discontinued a couple of years ago. If anyone has one, please
drop me email at PADAWER@UTKVX.UTK.EDU or telephone me at
(615) 637-7263.

Thanks!

Randy Padawer, WA4FJF

3234. Through the Glass - 1/4 wave 2 meters

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-30 23:37:23 UTC
From: root@mjbtn.JOBSOFT.COM
Message-ID: <10715@mjbtn.JOBSOFT.COM>
Source record: 293112

Hello,

I am looking for a "through the glass mount" *1/4* antenna for 2 meters. I have heard of one from Avanti, but can't seem to find anything there anymore. I have a Larson glassmount 5/8 wave now, but need something smaller. The tradeoffs in performance going to the 1/4 are no real big deal as all the repeaters I use are in easy range.

Any info would be greatly appreciated.

Thanks,

Mark.

|> Can someone tell me what the address of the station that has
|> the callbook online. I remembre doing it a few months ago,
|> but lost the info, Thanks, Mike

From the FAQ sheet...

Devon

If you are at an Internet site you can connect using telnet to one
of the two primary servers:

callsign.cs.buffalo.edu (currently 128.205.32.4)
ham.njit.edu (currently 128.235.1.10) (alias plan9.njit.edu)

The servers sit on port number 2000 which is a different port number
than what telnet usually defaults to. So if you just telnet to these
machines, you will get a login prompt instead of the server. How you
tell your telnet program to connect to port 2000 instead of the
default port is operating system dependent but it is usually done
with a line like

telnet callsign.cs.Buffalo.EDU 2000

If this doesn't work, consult your local systems guru for the proper
command string.

The interactive servers are designed to be somewhat self-explanatory
and they support fairly detailed help facilities. The first command
you should execute when connecting to one of these servers is "info".
This will list general info about that server and how to use it. You
should then type "help" to list the various commands available.
Typing "help" followed by a command name will give you a little more
detail about that command. Servers allow searches by call, last name,
zip code or city and also provide regular expression filters to trim
your searches so you get a reasonable amount of output.

Both these servers are built from a database distributed by Rusty
Carruth, N7IKQ. This database currently contains US and Canadian
callsigns and it does not contain club calls. A new version of the
database is sent around approximately once a year.

There is also an email callsign server at callbook@sat.datapoint.com.
In the body of the text, say "lookup" followed by callsigns you want
to look up. If your mailer appends signature files, you should put
a line "quit" at the end of your request (before the signature file).

If you want help, put the word "help" on a line by itself. Here is
what a request might look like:
help
lookup kc1sp wn4bbj
lookup n0fzd
quit

If you are a packet radio station, callserver data is available from
REQQTH@WA4ONG.VA.USA.NA, subject line should be up to 5 US callsigns,
separated by spaces. Body of message is ignored. The server is an
OS interface to the MBL packet BBS using the Buckmaster CD-ROM
callsign database.

3236. * Hewlett Packard ARC ..FYI.. *

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-01 01:23:45 UTC
From: mlau@pollux.svale.hp.com
Message-ID: <4680015@pollux.svale.hp.com>
Source record: 292837

FYI..........no flames please.

The Hewlett Packard Amateur Radio Club was founded during the 1950's and 60's. At that time the HP Radio Club had their own club house and beam antenna on a tower located on HP property at Page Mill Rd in Palo Alto, CA. The club was very active in the "old days" and operated with the call sign K6FB which was willed to the HP Amateur Radio Club by Ralph Elliot when he died of cancer in the 1950's. Today amateur radio operators who work for Hewlett-Packard can join the Las Cumbres Amateur Radio Club. The club currently has 170 members consisting of 50% Hewlett Packard/Las Cumbres members and 50% public members. The club owns and operates VHF/UHF repeaters located +3000ft high in Black Mt, Palo Alto (HP repeaters) and Castle Rock, Los Gatos/Santa Cruz (Las Cumbres repeaters).

K6FB/R 145.450mhz - [linked]
K6FB/R 442.575mhz + [linked]
K6FB/R 223.880mhz - [can be linked]
K6FB-1 145.050mhz Digipeater
K6FB-2 145.050mhz BB

The club publishes a news-letter every month called, "The Summit Sentinel". General meetings are held at the Hewlett-Packard Cuperino site, Building 48, Oak room (Wolfe Road and Pruneridge Avenue [entrance on Pruneridge]), 2nd Thursday of every month at 7:30pm. Talk-in on 145.450mhz. Every Monday night there is a NET held at 7:30pm followed by Amateur Radio Newsline. Check-ins on 145.450mhz or 442.575mhz repeater. Guess check-ins are welcome. If you would like to know more about the Las Cumbres Amateur Radio Club you can attend the next monthly meetings, October 10th, November 7th, or check-in on the Monday night nets or reply to this email.

Message-ID: <1991Sep30.204849.33941@kuhub.cc.ukans.edu>
Source record: 293108

Has anyone tried a side-by-side comparison of the two dual-band antennas
that Icom provides with their IC32 and IC24 HTs?

I had a chance to give the two antennas a non-scientific comparison. For
those that haven't seen the differences in the two antennas, the IC24 comes
with the FA1443BA, which is a thick, rubber coated antenna, about 6-7 inches.
The IC32 comes with the FA1443B, which is a much thinner more flexible
antenna. It has a thicker base, and a tappered upper end.

At any rate, on a multitude of 2-meter repeaters, the FA1443B antenna
outperformed the FA1443BA (that is to say, for the same power output
the antenna that comes with the IC32 seemed to work better for both
radios on 2-meters, and provided a considerable signal advantage compared
to the standeard rubber-ducker that is supplied with the IC24.) A comparison
on 440 was not made between the two antennas.

Has anyone else had a chance to compare these two antennas and come to any
conclusions?
From my findings, it might well be worth the money to buy a FA1443B from
an ICOM dealer, and shelf my old FA1443BA.

>Oh, well, I could be wrong. It happened once before :=)
>
>AL N1AL

After reading this, I "hit the books" (Audio Cyclopedia, Reference Data
for Radio Engineers, and Engineering and Operations in The Bell System),
and could not find a proper reference for this. Al is correct that
most of the test equipment is calibrated in dbm (600 ohm, 1 mw). I do
know that all of the analog test sets that I've used can be set for
both 600 and 900 ohm, and I was told that 900 for subscriber loops and
600 for leased lines.
But, I've been wrong before also.

BTW, many broadcast radio engineers, especially the older ones, feed a
broadcast loop at 150 ohm, it's supposed to flatten the response.

3239. Maxon 49 I Intercoms

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-01 02:30:45 UTC
From: Gogian_Yee.ES_GSD/WCO@xerox.COM
Message-ID: <"30-Sep-91.19:30:45.PDT".*.Gogian_Yee.ES_GSD.WCO@Xerox.com>
Source record: 293101

Hi John,
I had some experience in the intercom systems using the MAXON Series who I believe makes the intercoms for Radio Shack (c). I had purchased a set of MAXON FM Intercoms (49 I series) that have the convertable headsets which allows you to unclip the headband, remove the speaker from the headset and install the set-up on and into your Helmet using a patch of Velcro to mount the piece that has the boom mike and cord attached to the one micro speaker to the left side of the Helmet. The boom mike is bent to fit the inside of the Helmet if you have a full coverage version (I placed the mike so that it is in the bottom lip of the inside of the chin-bar and that gave me the best mouth-to-mike distance without overdriving the unit). I placed the micro-speaker, which is attached to the side unit by a small shielded cord, inside the left pocket where my ear would be. I set the speaker slightly forward, so that the front edge would be tilted toward the inside of the Helmet for best fit. The performance I found was that the units are at their best when on the streets (high to medium VOX setting), which allowed you to talk at near normal volume and also be able to hear the other riders without any trouble at all. At highway speeds, the units were virtually unusable- the VOX level would have to be set at LOW to keep the unit from TRANSMITTING ALL THE TIME, because of the highway/bike noises and also with the speaker volume all the way up so that you can almost hear what the other person is trying to say. Also, I found the remote PUSH-TO-TALK SWITCH, which came with the unit unusuable, because it ended-up picking-up the ignition noise from the engine and kept the intercom keyed-up all the time i had the engine running. Usually it would take several tries including sign language to get the words across. The other user(s) and I would find it very frustrating to use when at highway speeds. I had also perchased the MAXON EAR/MICROHONE intercom sets and found them to be even more cumbersome to use: the EAR/MIC tends to get yanked or pulled-out when you try to put your helmet on and if you're sucessful, the EAR/MIC WILL FALL OUT OF YOR EAR LATER ANYWAYS !!!! Even if it didn't, the EAR/MIC is so large, it usually is touching the inside lining of the Helmet and eventually makes your ear very sore. I found the performance very similar to the Headset version intercom on the highway. The last time I used the intercoms was on a vacation trip to Vancouver, British Columbia, back in '86 to the World Expo.
What I recently had done was to use the Headset for the passenger (No antenna whip) with the boom mike by splicing-in a 5-pin DIN plug with the "male" connector on the headset side to use as a quick disconnect (how many times have you removed your helmet at a restaurant and try to put it aside and end-up having yanking your intercom right off and onto the floor or try to walk away without unclipping the unit from your belt first ?...
I also ended-up just using the headset with a custom-made female plug-in harness which plugs into the new quick-disconnect DIN plug, which allows me to use my YAESU FT-470 HT instead !!! I found that with a Diamond dual bander antenna mounted on the tail-piece where the Rack used to be on my Concours, I

have 100% better communications (50-60% noise, but 100% copy) talking to other hams (and that's using the remote push-to-talk switch too). Now all I got to do is to get my riding buddies to get their Licenses... So far one of them is studying for the tech-no-code. That's what I have, but I'm presently working on the General. The code's a pain, nut that's another story...
Anyways, that's my contribution to the intercom story...

3242. AEA Isoloop Antenna

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-01 04:35:02 UTC
From: donnyj@milton.u.washington.edu
Message-ID: <1991Oct1.043502.21021@milton.u.washington.edu>
Source record: 293109

I'm moving from a house to an apartment situation but would like to keep working DX. I've seen adds for the AEA Isoloop antenna and am wondering if anyone has any experience with this antenna. Also, if anyone has good ideas for rigging an antenna that works well in an apartment, I would like to hear from you.

Thanks in advance
Don, KB7JKA

A repost of a repost.....

~Date: 21 Dec 89 04:24:28 GMT
~From: jrs@hpfcso.HP.COM (John Spencer)
~Subject: Re: Where to buy cables?
Organization: Hewlett-Packard, Fort Collins, CO, USA
~Lines: 27

I made my own DIN to RCA phono plug cable for my ATS-803A. I used two 42-2370 cables and one 274-003 DIN plug. Sangean sent me information on the pinout of the DIN:

3
2 4
1 5

Pin Function

1 Left channel

2 Right channel

3 Ground

4 unused

5 unused

You may need to note that European DIN output levels are lower than the US line input levels. I found that the volume control had to be set at maximum for normal listening volume. Another solution is to use a resistive divider and plug into the microphone inputs of an amplifier or tape recorder. A divider can be easily made using a 2700 ohm series resistor and a 1000 ohm shunt resistor. The divider limits the DIN output to 38% of its normal output so the microphone preamp will not be overdriven.

Source record: 292971

Classy valve amplifiers using the likes of the venerable KT88 gave around 1% distortion, open loop in the "Williamson" circuit where the beam forming plates are tapped into the output transformer. The closed loop distortion figures in the 0.1% region fit well with an estimated 20dB of feedback.

Far larger distortion percentages were tolerable in the valve era, because the shapes of the non-linear transfer functions produced spectral components resembling those already present in music and speech in similar proportions, thus the programme material masked the amplifier's failings. The characteristi -cs of semiconductor amplifiers, especially cross-over effects, tends to produce much more power at the higher order intermodulation and harmonic frequencies. People find this far more noticable.

There is a fashion (nothing nore than a fashion) for low amounts of feedback. The low amounts of feedback of the valve era were cited as justification. The reason for low feedback was that it was applied around the output transformer, and that stray effects and leakage inductance led to bad trouble with stability and ultrasonic oscillations if more feedback was attempted. There would also have been the then high cost of having more stages to provide the extra open loop gain needed, besides, they got good enough results and didn't need more feedback.

As has been pointed out, the valve's output looks like the slope of its characteristic curve (at the operating conditions) the loudspeaker is presented with this, transformed by the square of the transformer ratio, then reduced further by feedback if any. The transformer presents a load to the anode equal to the loudspeaker impedance (at that frequency, and it varies wildly with f) transformed up by the square of the transformer ratio. This situation is NOT in any way MATCHING, maybe it's best called loading. This exactly parallels the circumstances of a semiconductor PA driving an antenna via a transformer and a feed line.

If your power supply voltage is fixed, you can easily estimate the voltage swing at the active device (whatever it may be) It is now a doddle to calculate what impedance that swing must be loaded with to extract the wanted amount of power. Simple calculations give the flowing currents and the dissipation in the active device, so you can now raid the data books for a suitably rated device. You know the actual impedance of your load, now just calculate the transformer ratio needed to convert it to the effective load impedance to be presented to the active device. This misses out on a few sublties, but it is the foundation of power amplifier design. Life is easier than many people seem to think.

I haven't compared the 2 Icom antennas to each other.
However, I compared the FA1443B (the one supplied with the IC-32)
to the fat heliflex supplied with my Uniden/Bearcat 200xlt
scanner and the FA1443B performed better for scanning.

I bought the pre-owned FA1443B at a hamfest.

3250. Re: FA1443BA vs FA1443B antennas

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-01 13:01:44 UTC
From: gettys@regent.enet.dec.com
Message-ID: <28347@nntpd.lkg.dec.com>
Source record: 292924

Having had an IC-24 and now having an IC-W2A (which comes with the same antenna as the IC-32) there is no question about the worth of the dummy load that Icom calls the FA-1443BA. There seem to be three readily available antennas that work well on the extended frequency range of the dual band walkies. The Icom FA-1443B, the Larsen 2/70, and the Diamond RH-77 (although this one is a bit long for ordinary use).

When I bought the IC-24, I had the IC2SAT and I used the weather at 162.55 as a test of the out of band sensitivity. The IC@S heard it with no problem and the IC-24 couldn't find it. Swapping antennas - swapped results! I immediately bought the Larsen which worked well. In fact, when I sold the IC-24, the FA-1443BA hadn't even been out of the bax since I bought it!

I believe Mr. Engehausen is posting these precisely for the whole country
to read -- the California RACES people already get them in some other
way. As someone active in emergency communications, I appreciate the
posting of these bulletins (although I don't always agree with their
opinions and prescriptions). It's useful to know how it's done in
other places.

I modified my FT470 for extended rx on 70 cm (430 - 500 MHz)
by removing one of the SMD resistors. What I discovered was that I could
also tune from 800 to 950 MHz. I haven't yet received anything from this
band. You can tune there simply by entering the frequency from the
keyboard.

Does this rig receive on this frequency range?

I just bought a spiffy new IC-W2A, and I'm looking for any mods for it,
including extending receive on both VHF and UHF. I've heard that this
thing is capable of AM rx below 138MHZ.

Please mail me direct, and I'll summarize.

Bert,
I, for one, think that the FCC should start reissuing some of the oldest
expired calls - now that they are running out of Extra-style calls.
I note that the FCC has signed a contract for a new software system, maybe
we should push NOW for fixes in their call policy.
NOT AN OFFICIAL STATEMENT !!!!

>cannot seem to find an antenna switch that would allow me to rotate antennas
>in this fashion.

You can use a 5 gang rotary switch with each radio connected to a switch wiper and the antenna leads bussed to the contacts with a one position offset at each deck. At HF an ordinary rotary switch is fine for switching coax antenna feeds. Just tie all the shields to the metal box you put the switch in. For VHF/UHF you have to maintain impedance which would call for some fancy coax harnesses and quality coax switches.

A better approach IMHO is a switching matrix. Make 5 busses horizontally and however many it takes for your antennas vertically. At each intersection put a switch, toggle switches are fine at HF, and close switches to connect the desired radio to the desired antenna. You can feed several radios off the same antenna if you like with this method though there will be some loading effect. There's usually enough signal level at HF that the loading won't be a problem.

> [The usual load of rubbish]
>ps-to-the-rest-of-the-group: I did us a favor...think of it that way!

You have convinced him that Radio Amateurs are a bunch of childish assholes who make the worst CB-freebander's look like Miss Manners, who richly deserve all the interference he can generate? That's a favor I think we can do without.

To Rob Henry: It is correct that you need a license to use amateur frequencies. Do indeed pick up a copy of the Radio Amateur's Handbook by the ARRL (the title is now "The ARRL Handbook for Radio Amateurs", actually, but a library will likely have the older title), but instead of looking in it for evidence of your intelligence, look at how easy it is to get a genuine license -- nowadays, the Technician license does not even require a Morse code test for operation above 50MHz. Better yet, you can write to the American Radio Relay League and ask them about information on becoming a licensed Amateur Radio operator; their address is

ARRL
225 Main Street
Newington CT 06111

Ham radio is easy to get into, and a lot of fun, and I promise that (aside from the occasional Sorgatz) you'll find most hams are interesting, courteous people.

Well, one simple way to do it is set up a simple patch panel. Have all your antennea terminate in BNC bulkhead jacks mounted onto a piece of sheet metal somewhere easily accessable on your operating table, and have short BNC cables which go to each receiver. Anytime you want to switch antennea, just switch the BNC plug. (I suggest BNC because they are simple to connect and disconnect, but any type of connector will do, like PL-259 or N type.)

I have seen the type of switch you are talking about for RS-232 ports, there may be some around, but I'll bet you could pay some big bucks for them.
Hope that helped.

With reference to the question about the carbon element and earpiece from a standard WeCo (Western Electric) "500" set, the impedance of the carbon transmitter is a nominal 150 ohms +/- and the earpiece has an impedance of about 300 ohms. The telephone instrument is a nominal 600 ohms at the 2 wire interface, due to the fact that there is an internal r-l-c network {known as the 425 network in AT&T Technologies (formerly WeCo) phones}. Also, the earpiece cannot pass dc, so be sure to use a large cap, i.e. 0.5uf for blocking. Network in the phone also serves the purpose of providing the "correct" amount of sidetone so that the talker hears a portion of his or her own voice during conversation. This return energy serves no purpose other than to feed back your own voice into the earpiece at about 15 to 20 dB down for user confidence that there is talk battery on the line.

I recently purchased s used Uniden HR2600. It came without a manual, so I am looking for some infomation on it:

1. How do you program the PL encoder? I know it is done with DIP switches, but what is the sequence for the different tones? For example, if I want to set PL 5A, which is 156.7Hz, what would I set the switches to?

2. How do you hook a CW key to the thing? I know it is via the molex plug on the back panel, but which pins should I use? What are the other pins used for?

Jon

3274. IC-735 VS TS-450S, info wanted

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-01 17:10:09 UTC
From: sl9j3@cc.usu.edu
Message-ID: <1991Oct1.111009.49468@cc.usu.edu>
Source record: 293121

Having just recently passed my exam, I have been looking for
a good HF rig to purchase. I have narrowed the choices down
to the ICOM IC-735 and the KENWOOD TS-450.

Since I have no access to either of these rigs, I am asking for
input as to why, or why not I should go one way or the other.
One big why-not for the TS-450 is that it is approximately
$400 more than the IC-735 (about $300 more base price plus approx $100
for a mike. The IC-735 comes with a mike). Another difference is
the Noise Limiting of the 735 vs. the Noise Blanking of the 450.
I have no idea of the pros and cons of Noise Limiting vs. Noise Blanking.

If you have experience with either of these rigs, I would appreciate
your input. I will post a summary if there is interest for it.

Thanks.

Bruce

3275. Yaesu FT-411E question

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-01 17:47:00 UTC
From: DERRY@ROSEVC.Rose-Hulman.EDU
Message-ID: <7584662CA0E01395@ROSEVC.Rose-Hulman.Edu>
Source record: 292949

My question is about a Yeasu 411E HT. I think I have my Kenwood TH25AT sold. I will replace it with a 411E.

Question:

Can I operate the 411E from my little 12-v, 1.9-AH, storage battery?

If so how do you connect the battery to the HT?

If the answer is just plug it into the little port in the battery pack, the same place where you plug in the charger, then:

(a) will this overcharge the battery?
(b) will I get the rated 5 W that 12-V is supposed to produce?

Is there an adapter like the Kenwood has that fits where the battery pack attaches to the HT?

Is it smart to operate the rig while the battery pack is being charged?

People I know who own FT-411E rigs don't know the answers to these questions. Does anyone out there?

Thanks very much, Jack, K9CUN

I have to disagree. I have enjoyed seeing these posts, and I think Roy's
done us a service by forwarding them. I am not involved in ARES/RACES, but
the posts have been of value to me in helping me to better consider how I
might be more prepared for those emergencies that I could encounter. Also,
I think that indirectly they serve as good recruiting material for RACES.

Why do you folks think that AARL "should" object to Section 8?

After all, it is just banning those nasty, not good for any legitimate
use, scanners, not real amateur radio receivers.

In return for throwing them to the dogs, where they belong, the AARL
gets to hand out callsigns and can say that it protected hams from
license fees. That's a win-win deal for the AARL.

I don't agree with the AARL's position, but it is to be expected.

In article <30.Sep.91.14:28:45.BST.#5515@UK.AC.NWL.IA> PJML@ibma.nerc-wallingford.ac.UK (Pete Lucas, NERC Computer Services, Swindon) writes:

Other musical works with morse-embedded:

'Radio-activity' by Kraftwerk, contains all sorts of CW. Some of it being tuned through, so the tone goes from high to low then back to high (audio image? they need a decent set of filters!).

RADIO K.A.O.S. (John Waters) has a load of morse in places.

Finally, I am told that the theme tune for the 'Inspector Morse' TV detective series (which you Statesiders may not have bought off us brits yet) is actually based on the rhythm of the morse for the letters M O R S E. This was told to me by someone who studies music!

Finally-finally, some of the works of Isao Tomita (a mid-70's vintage Japanese electronic music composer) have what sound suspiciously like packet in certain places... i tried feeding them into my TNC but got nothing; the 'braaaap!' sure sounds kinda familiar though...!

The West coast group Negativeland has several tracks where ham radio audio is used, though phone and not code. They seem like real calls too but I haven't looked em up.

The also mention a repeater in a piece I heard last night but again I didn't remember the call.

Contact the ARRL Educational Activities Department (EAD) by mail or telephone
as shown below. They have an informational package called the Prospective
Ham Package that will be sent to you free of charge.

Another good source of help getting started is a local ham club. EAD can send
you a list of local clubs and contacts to get you started. Direct any email
requests to EAD to 2155052@mcimail.com . Include your postal address
because EAD cannot respond via email.

The ARRL VEC can supply you with a printout or email copy of upcoming
test sessions. Contact bjahnke%arrlhq.UUCP@uhasun.hartford.edu for
exam information.

This information supplied as a courtesy by KA1CV in the ARRL Lab. Please
direct email as shown above. Thanks, 73, Ed.

Any listings in QST or ? for: National Contest Journal or QEX?

I had a chance to batch ingest two years worth of NCJ at my brother-in-laws house and decided to subscribe. But cannot find ANY!!! indication of how to do so in QST. There isn't even a note in the contest section about it.

What happened? Is this a new, SECRET process? Are these publications no longer accepting new subscribers? What gives?

>gets to hand out callsigns and can say that it protected hams from
>license fees. That's a win-win deal for the AARL.

[uh, A*R*RL]
It's worth noting that the bill doesn't even mean they get to hand out callsigns. As I recall, the wording was "the FCC may use the services of..." and I doubt that anyone at the FCC previously believed they didn't already have the authority to delegate that task. At best, the FCC will take it as a friendly hint, at worst they will shrug it off and ignore it.

I rather think that the ARRL caved in on Section 8 out of fear of linking hams with eavesdroppers in the minds of Congress or the public. Who knows, maybe the real quid pro quo was an agreement with the cellular telephone industry that the ARRL would "promote" section 8 in exchange for a promise not to demand ham spectrum for cellular telephones until at least Christmas...

3286. Middle Latitude Auroral Activity WARNING

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-01 20:18:07 UTC
From: oler@hg.uleth.CA
Message-ID: <0094F782.248CE640.11121@hg.uleth.ca>
Source record: 292958

/\

MIDDLE LATITUDE AURORAL ACTIVITY WARNING

ISSUED: 19:30 UT, 01 OCTOBER

/\

HIGH RISK PERIOD: 01 - 02 October
MODERATE RISK PERIOD: 01 - 03 October

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: MODERATE - HIGH

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: >50 North Latitude

POTENTIAL LUNAR INTERFERENCE: MODERATE

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: GOOD - FAIR

There appears to be a good opportunity developing to observe potentially moderate to high levels of auroral activity over the middle latitude regions during the local evening and early morning hours of 01/02 October. Activity has presently increased in response to an interplanetary shock which arrived at 18:15 UT on 01 October. A possible source of this shock was the impressively large class M7.3/4B solar flare of 29 September.

Conditions should be best during the evening hours over North America prior to moonrise. After the moon rises, lunar luminosity will significantly wash out any visible color or detail in auroral activity.

The days of 01 and 02 October (local time) are expected to provide the best opportunities for auroral observations over middle latitudes, with the former (tonights activity - local evening of 01 October) being the potentially strongest period of activity.

** End of Warning **

3287. Burr Brown IBM/AT DSP card?

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-01 20:31:44 UTC
From: az@i5120h.nrl.navy.MIL
Message-ID: <9110012031.AA07116@i5120h.nrl.navy.mil>
Source record: 292957

Good Day,

I wonder if anyone out there can assist me with a problem I'm having
with a Burr Brown DSP card I recently acquired, at a local hamfest, for a
real deal. I picked up an IBM/AT card made by B.B., which has an AT&T DSP32c
and 64Kb SRAM. The model number of this card is ZPB-34-001. This card has
several banks of DIP switches. My first question relates to these. What do
they set? I imagine IRQ, Base address, etc. Also it appears that the cards
onboard memory can be expanded to more than 64Kb. There are 2-3 more rows
of sockets near the 1 row of 64Kb. Thus, my second question...what chips
belong here? SRAM? DRAM? Part/manufacturer numbers?
Unfortunately the board came with no documentation. What can you expect for
$25! So, if anyone out there has, or has used this board and can give me some
insight on how to set this board up, I would much appreciate hearing from you!
If anyone has docs on this board, I'd be glad to work out an arrangement for
acquiring the necessary information.
As a side note...What do you reccomend for development tools for this
or any other IBM card using the AT&T DSP32c? Also, what seems to be the DSP
chip of choice these days? Anybody have a brief set of pros/cons for the
AT&T, TI, Moto...DSP chips?

Please respond direct and thanks for your time.

3288. Alerts - Shock Arrival - Proton Event - Storm Warning

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-01 20:50:55 UTC
From: oler@hg.uleth.CA
Message-ID: <0094F786.BAD3D420.11324@hg.uleth.ca>
Source record: 292968

/\

SOLAR TERRESTRIAL BULLETIN

ISSUED: 19:15 UT, 01 October

SATELLITE MAGNETOPAUSE CROSSINGS
ALERT! - PROTON EVENT BEGAN 1740 UT
ALERT! - INTERPLANETARY SHOCK ARRIVED
GEOMAGNETIC STORM WARNING

/\

GEOSYNCHRONOUS SATELLITE MAGNETOPAUSE CROSSINGS MAY BE POSSIBLE

The GOES-6 spacecraft penetrated the magnetopause between 19:43 and
19:50 UT. The GOES-7 spacecraft has not yet experienced any boundary
crossings. However, there is a threat for potential periods of magnetopause
crossings of geosynchronous satellites over the next six to twelve hours.

ALERT! - PROTON EVENT IN PROGRESS

Satellite protons at greater than 10 MeV began increasing at a more
rapid pace after about mid-day on 01 October. Protons passed the event
threshold of 10 pfu at 17:40 UT on 01 October. They are presently fairly
stable near the event threshold. This event is not expected to last very
long, barring future major proton flares.

Polar Cap Absorption levels have increased notably over the last six
hours as a result of the elevated proton fluxes. The combined effects of
the recent interplanetary shock arrival and the elevated proton levels have
produced blackout or near blackout conditions over the polar, high and some
northerly middle latitude regions. Other middle latitudes are currently
experiencing quite significant degradations in HF signal propagation. Low
latitudes are also suffering some degradation, although the magnitude is not
as great.

INTERPLANETARY SHOCK HAS ARRIVED

An interplanetary shock arrived near 18:15 UT on 01 October. A sudden
magnetic impulse observed on ground-based magnetometers as well as at
geosynchronous altitudes occurred at 18:15 UT. The magnitude of the
ground-based SI was between approximately 15 and 30 nT over middle latitude
stations.

Following the shock, high and northerly middle latitude HF signals
became very poor over the daylit regions with blackout to near blackout
conditions being observed over many areas.

GEOMAGNETIC STORM WARNING

A geomagnetic storm warning has been issued. There is a risk for minor to possibly major geomagnetic storming over the next 24 to 48 hours. HF signal propagation will range from fair to very poor over the polar to some middle latitude regions. Low latitudes should observe conditions ranging from good to fair throughout the period.

** End of Bulletin **

3289. Re: Plans for a small transmitter/receiver

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-01 21:04:03 UTC
From: rc@cmr.ncsl.nist.gov
Message-ID: <9110012104.AA15665@cmr.ncsl.nist.gov>
Source record: 292964

The egregiously offensive reply (from philabs!ttidca!sorgatz) to this rather naive request for information does our group no credit.

1) For the distances in question, a license is almost-surely required - unless you choose Citizens Band, where you are not allowed to build your own equipment.
2) The no-code amateur license exists, and the theory test is so simple as to make it almost a no-theory license as well. You ARE required to know the most critical FCC rules concerning amateur radio.
3) You should bone up on the FCC rules, which you can find in various ARRL (and other) introductory booklets about amateur radio.

Everybody has to start somewhere, and I think it a very good sign that someone is still interested in actually BUILDING some electronic equipment. Wouldn't the "portable equipment" section of the ARRL Handbook have info on simple gear. Certainly the Doug Demaw collections from ARRL contain a number of fairly simple rigs/receivers. ONE WARNING, novice constructors should **** NOT ***** try to build extremely small, miniaturized equipment. Miniature construction techniques are best left until after you have some experience.

>W0RSB (my current call) which I got in 1977 and
>W2HIR which I got in 1973.
>My original call, of which I was the first (and, so far, only) owner was K3OCN
>which I got in 1961.

>Like I said, this is idle curiosity, so don't anybody work too hard (if at all)
>on this one.

Back about mid-1975 I casually asked a friend if my father's old call
(which he had forgotten) could be looked up. He told me that the ARRL
had a full set back to the beginning.

My late father WB6SOX was (if _my_ memory serves me right) 6AAU or 6AUU.
And when he decided to get his call back, my mom joined in and got
WA6SOX... A could local hams called them the unmached pair of SOX.
And then KA6SOX showed up on the channel.....

Anyway, drop a letter to the league.

Source record: 292976

Wow! I'm really surprised at the amount of intemperate language and
the allegations that spewed forth from query that Rob Henry made a
couple of days ago. Surprised and disappointed......

Rob: The information you requested is easily obtained in your library.
If you need specific references I'm sure that private mail to one
of the folks that have stepped in to your defense will be fruitful.
I advise you to be careful in the the selection, construction and
operation of your device. There may be a couple of ways to do it
right, but dozens of ways to do it wrong. I believe you were right
to ask for advice. I do not believe your response to Eric showed
that you were any better prepared to deal with people than his showed.

Erik: I tend to believe that you were blowing off steam due to some
problem not related to Rob's post. If that was the case then I
encourage you to say so. If not, then I too am ashamed of your
outburst for it casts all hams in a poor light. Here on the
internet you are surrounded by your peers. None of them have come
to your defense. Indeed, many have criticized you for the tone
and content of your post. If I were in the same position, I believe
I'd reflect on that.

Aaron: The airwaves are in the public domain in the same spirit that
our parks are in the public domain. They are maintained for the
benefit of all to use, but within certain usage restrictions.
Your claim about frequency and power usage is not entirely correct.
I suggest that you or Rob research the appropriate restrictions before
risking the violation of federal law. If you lack the ability or desire
to do the research, I advise you to consider contacting a supplier of
commercial radio equipment. You may be able to rent the equipment for
less than you'd pay to construct equivalent gear, and you'd spend a lot
less time doing it.

All: This is a technical forum where a reasoned, well thought out post is
valued above all. Flames, cursing and threats benefit no one and detract
from the value of this technical interchange. If such language is really
necessary then please move it to the private mail. I believe I speak
for the rest when I say we aren't interested in hearing grown men curse
at one another and that we'd rather get on with the real reasons why we
came here in the first place.

I hope we can get back to business now.

3294. Low Latitude Auroral Activity WATCH

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-01 22:06:42 UTC
From: oler@hg.uleth.CA
Message-ID: <0094F791.507D88E0.11635@hg.uleth.ca>
Source record: 292973

/\

LOW LATITUDE AURORAL ACTIVITY WATCH

ISSUED: 03:00 UT, 09 SEPTEMBER

/\

MODERATE RISK PERIOD: 10 - 13 September

POTENTIAL MAGNITUDE OF LOW LATITUDE AURORAL ACTIVITY: MODERATE

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: 47 - 55 North Latitude

POTENTIAL LUNAR INTERFERENCE: LOW

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM LOW LATITUDES: FAIR

The probability for energetic auroral activity over the high and middle
latitudes is sufficient to warrant a Low Latitude Auroral Activity WATCH.
This watch is in effect from 18:00 UT on 09 September to 24:00 UT on 12
September. Conditions may become favorable for isolated auroral activity
observations from low latitude sites (ex. equatorward of 40 N latitude).
Lunar interference will be low, which should provide optimum conditions for
observing auroral activity from dark-sky sites at low latitudes. The UT days
of 10 - 11 September are expected to be the most energetic days although a
moderate risk will continue through to 13 September.

** End of Watch **

3295. CORRECTION - Low Latitude Auroral Activity WATCH - 01 October

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-01 22:48:16 UTC
From: oler@hg.uleth.CA
Message-ID: <0094F797.1F78A620.11872@hg.uleth.ca>
Source record: 292959

/\

LOW LATITUDE AURORAL ACTIVITY WATCH

ISSUED: 19:30 UT, 01 OCTOBER

/\

MODERATE RISK PERIOD: 01 - 02 October

POTENTIAL MAGNITUDE OF LOW LATITUDE AURORAL ACTIVITY: LOW - MODERATE

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: >50 North Latitude

POTENTIAL LUNAR INTERFERENCE: MODERATE

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM LOW LATITUDES: FAIR

There is a possibility for the observation of auroral activity over some low latitude regions during the local evening and early morning hours of 01/02 October. The best opportunities for potential auroral observations exist during the local evening hours prior to moonrise. After the moon rises, auroral activity will become much more difficult to observe. These potentially favorable conditions are expected to persist for approximately the next 18 to 24 hours over the low latitudes.

The region forecasted to be within the night sector during the potential maximum period of auroral activity is North America.

** End of Watch **

Everyone jumped so quickly with knee-jerk flaming that I almost missed
this tidbit. You might be able to get a 3 block range under Part 15,
the FCC's rules covering very low-power broadcasting. I get about a
block-and-a-half with my $29.95 FM stereo transmitter kit from Ramsey
Electronics, using the recommended dipole from indoors on the ground floor.
With a dipole on the roof and good receive antennas I could get more than
3 blocks easily.

And it's legal and entirely unregulated broadcasting.

"I modified my FT470 for extended rx on 70 cm (430 - 500 MHz)
by removing one of the SMD resistors. What I discovered was that I could also tune from 800 to 950 MHz. I haven't yet received anything from this band. You can tune there simply by entering the frequency from the keyboard."

"Does this rig receive on this frequency range?"

"73 de Wes"

No I'm afraid not. From my experience, the 470 on the 70 cm band, the receiver's reasonable sensitivity is from approximately 300 Mhz to about 510 Mhz (That's the range that i can pick-up public service communications). You can tune the the VFO from 0 Mhz to approximately 1.2 Ghz, it's just that the receiver's front-end isn't very sensitive at all too far from it's original design band.
P.S. My 2 meter range is set from 108.025 to 204.295 Mhz...

>realize that KB6LUY is hardly representative of mainstream amateur radio.

Nor is it representative of amateur radio in general. There are always going
to be those in whatever you do that are jerks... just too bad he gives such a
bad representation of the reported half-million hams in America.

/\

SOLAR TERRESTRIAL BULLETIN

01 October, 1991

MAJOR SUMMARY OF SOLAR ENERGETIC EVENTS
FOR SEPTEMBER 1991 NOW AVAILABLE

/\

MAJOR PRELIMINARY SUMMARY OF SOLAR ENERGETIC EVENTS FOR SEPTEMBER

The major monthly report of solar energetic events for the month of
September, 1991 is now available for anonymous FTP from: solar.stanford.edu,
in the "pub" directory and from the site: nic.funet.fi in the
"pub/dx/solarreports" directory. The file to obtain is "flare-summary.sept".
The file is over 65 K bytes in size, and is the most comprehensive
preliminary report of solar energetic events presently available.

If unable to obtain the file through anonymous FTP, the file may be
downloaded from the STD BBS at: (403) 756-3008. The file may be found in
the File section (file area: Solar Reports & Reviews) under the filename:
SEPFLR.DOC.

I have been thinking about getting a 1000D on and off for about a year. With the DX season here again, I'd be real curious to hear experiences/opinions from anyone who has one. Or, if you evaluated one and decided against it, why? (I understand the money issue - my first couple of cars cost less...) I operate mostly CW, and the 2nd receiver, particularly with the sterio feature, seems like a real winner for CW pileups. I currently have a TS-940 with the IRC mods (FT filters, slow tuning). Thanks.

Well, if it's the "Q" signals you need (QRZ, QTH, etc.), those are in 'most any logbook. Otherwise, senders usually just leave out enough letters so that the meaning becomes clear in context. "wl" for well; "gng" for going; "luk" for luck; "tmrw" for tomorrow, etc., etc., etc. Best way to learn them is to just copy a lot of QSOs (contacts). That should be easy enough, since your friend has a license already. Gd luk!

I'm always amazed at the flaming that goes on on this net in response to honest reauests for information. But KB6LUY's vitriolic attack on Rob Henry takes the cake! I'm ashamed that a Ham call sign was placed under such a load of crap. There's no call for that in amateur radio.

Many of us started out just as Rob is thinking of doing. Instead of pummelling him for asking, why not just kindly direct him to some sources?

73,
Dube AB5AP

PS... I said *kindly*

I'm a beginner in radio,that's why I asked the questions I did.
Being a beginner I don't want to buy a million dollar system right
off the bat.If i can build omething to toy around my house with
for the time being,what's wrong with that?
I cannot get enough power,nor hae the desirre to override stations or do
otherwise illegal activities.

Now,I already have source for plans
better than ANYONE on here could possibly
give me.I also have a few new found
friends on this base(thanks to you all,you know who you are and deserve
more,but hey,we're in different parts f the country).So sorrygatz and scoott and that other guy,
why don't you find someone else to "flame" and leave
this base to us REAL AMATEUR radio users.

How do you think professionals come about?They come about by
LEARNING and ASKING QUESTIONS.
You are not born with this stuff naturally
implanted in your brain.

Source record: 292884

I am re-posting this request for a friend as it seems to have fallen
on deaf ears.

I am the proud owner of a new Alinco DJ560T, but the Australian 70cm band
extends ALL THE WAY from 420 to 450 MHz ! Could someone please advise me
of the modification to open up the transmit coverage ? Also, will this radio
act as a cross-band repeater ? This is a very useful function, which I
commonly use at home with my DR570 and a two metre handheld. With a dummy load,
I can patch everything from our UHF channel to a 2m 'link', and walk
around the house operating my base radio remotely.
Does anybody know this mod, if it is possible ?

Thanks. Ron VK3EHF.

Please respond by email to me (devos@mundil.cs.mu.OZ.AU)
(internet 128.250.35.27) as well as to to the group if you wish.

forgive me if I have been impatient.

Thanks,
Stuart. VK3EQL.

3309. Looking for Uniden/BC 200xlt mod

I am rather new to the radio world, but I have gone so far as to pick up what seems to be a pretty decent scanner. (I figgere'd it would give me something to do until I get my license..)... In any event, I see no reason why a synthesized circuit can't pick up certain bands(as a matter of fact, I'm sure that it can..) I am particularly interested in < 47 Mhz, but any mod available for this scanner would be greatly appreciated.

Is there a site that archives rig/scanner mods??

Hello all! This message is really just a test to see if I can get into the internet from my BBS. However, I did have a packet related question (I just realized, wrong area). Anyway, I was scanning with my scanner and heard what I thought was packet, but not in the ham bands. Will a ham radio TNC decode other services packet, i.e. police?? Thanks!

It stated on one of his album jackes that there was ascii text on the record
that could be decoded with one of the popular casset interfaces of the time
(I don't remember the details). Did anyone ever decode this stuff?

>(whatever that specifically means) impedance.
>
It is really rather simple: For a transient, a conductor behaves as a
transmission line if the amount of time for a wave front to travel down its
length is on the order of the risetime of the signal. For a steady state
problem such as coax carrying RF I suggest that if the electrical length
of the line is on the order of at least one eighth of a wavelength
(half of a quarter wavelength) then it would appear to have the
characteristics of a transmission line (like a characteristic impedance).

So the answer is that depending on the frequency (hence wavelength)
of the signal and depending on the electrical length of the line, it
will either appear as a lumped element or a T-line.

>Wow! I'm really surprised at the amount of intemperate language and
>the allegations that spewed forth from query that Rob Henry made a
>couple of days ago. Surprised and disappointed......

All right!! The bad old days from rec.ham-radio are back! And no one even
mentioned code yet! (:-) <- See the smiley face! It's a joke. OK?)

I'm surprised, too. But maybe we really can get back to the technical
discussions now.

Michael

The "airwaves" are not in the "public domain" in any meaningful sense. Use of the electromagnetic spectrum from DC up to 60 Ghz is completely governed by the FCC; transmissions may NOT be made except in accordance with the relevant FCC regulations. To do so violates federal law. The FCC can take action against violators whom they license, and the Justice department (i.e., FBI) can act against non-licensed violators. In recent years, new restrictions on the use of the spectrum have been applied to *reception* as well as transmission (e.g., satellite and cellular phone signals). Yes, you have to violate big-time to get the attentions of the feds, but the principle holds. Our friend who says he'll transmit where and when he likes is simply a scoff-law, and has in a small degree violated both the law and the social contract that makes our society work.

[The opinions expressed are my own, and do not necessarily reflect the views of my employer]

3322. ARRL VEC Exams Scheduled 9/20 - 11/4/91

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-02 13:17:25 UTC
From: bjahnke%arrlhq.UUCP@uhasun.hartford.edu
Message-ID: <256@arrlhq.UUCP>

AMATEUR RADIO EXAMINATION OPPORTUNITIES

The following test session information is provided by the ARRL/VEC for the upcoming six to eight week period. For further information, please contact the test session CONTACT PERSON at the telephone number provided. If necessary, you may contact the ARRL/VEC at 203-666-1541 x282 for additional information. Email may be sent to the ARRL/VEC at:

bjahnke%arrlhq.UUCP@uhasun.hartford.edu

You should include your postal address (the slow kind) in case we need to send you non-electronic material in answer to your question.

Although the test session information presented here does not indicate whether walk-ins are accepted or not, most test sessions do allow walk-ins. We encourage you, however, to always contact the CONTACT PERSON at the telephone number provided so that the VE Team is aware that you be attending the test session.

EXAMINATION OPPORTUNITIES IN YOUR AREA: 9/20/91 to 11/4/91

3323. Re: Lid of the Month

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-02 14:05:17 UTC
From: datwyler@javelin.sim.es.com
Message-ID: <1991Oct2.140517.11349@javelin.sim.es.com>
Source record: 292880

I find it interesting that as quickly as we can, we go from "HT's on aircraft" burning each other on 20m worth of antenna parts.

I know we all aren't perfect. I sound like "Mr. Avatar" ocassionally when I yell at my children.

Just last night, I ran into three very sincere and informative people on the air(15m), and have rarely met anyone who would not be civil (except some dx'ers).

So, to all netters, let's flame when flaming is due.

And let's be nice the rest of the time.

Thanks.

3324. The Call Sign Mess

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-02 14:33:05 UTC
From: taormina@asl.SINet.SLB.COM
Message-ID: <9110021433.AA26056@sjosu1.sinet.slb.com>
Source record: 292896

Issuance of call signs has been, traditionally, one of the
things that the FCC has done very badly. In most commercial
services, a call sign is just a nuisance. In broadcasting,
it is a logotype or a statement of broadcast format. In Ham
Radio, IT IS YOUR NAME! (W6BIP actually goes by "Bip"). You
become your call sign (like W9 Ragtime Cowboy Joe!).
Vanity is a big part of our hobby, but seldom part of the
FCC budget. Up until the 50's, call sign issuance was
pretty straight forward. They issued W5AA then W5AAA then
K5AAA call signs. 1 x 2 call signs with an "X" prefix
(i.e. W5XJ) were reserved for experimental stations. When
they ran out of W5AAA and K5AAA they reissued calls that had
been inactive for 5 years. Club stations had their own calls.
A club could request the call of a "silent key" former member,
with the family's approval. You could have as many call signs
as you had addresses.
Then it happened! In the late 50's they ran out of W5XXX and
K5XXX call signs. For a while they issued WV/WA call signs
(I was WV2GGB as a novice and WA2GGB as a general).
They didn't think ahead about the WV4's being a novice call
in the Virgin Islands, so that didn't last. Then came
"incentive licensing." Until that time, when you became a
General, you had all amateur privileges. At the same time,
cutbacks and computer constraints did away with multiple call
signs, club calls and repeater calls (Our repeater was WR5AIC
for a short time). For another brief time in the 70's, Extra's
could pick their own 1 x 2 call sign (I gave up WA5LES for K5RC).
Shortly after that, the FCC instituted the current madness.
It started out as a fairly good idea to have call signs reflect
the class of license, but they made the fatal mistake of not making
it mandatory when you upgrade. They also didn't look far enough
ahead to see what would happen when they ran out of particular
blocks of calls. Now we have a system that makes less sense
than it did before. Why can't call signs be reissued? Computer
technology certainly can support it. Why can't a private agency
(such as ARRL) issue call signs? That has plenty of precedence
in business radio. How about a system that issues sequential
call signs to new Hams, after 1 year, you can request a 2 x 3,
an Advanced a 2 x 2, an Extra a 2 x 1 and an Extra, after 10 years,
a 1 x 2? Let's acknowledge our vanities and join the computer age!

73 and DX,
Tom Taormina, K5RC

Remember, it's only a hobby.

3325. Whatever happened to...

Newsgroup: rec.radio.amateur.misc

There is no secret about NCJ or QEX. There is a nice blurb about
NCJ in the October QST and these shorts are run regularly about QEX.
Give the Circulation Department of the ARRL a buzz and they can tell
you how to sign up. NCJ is $10 per year or $19 for first class mail.
If you like, I'll be happy to send sample issues of NCJ.
73 and DX,
Tom Taormina, K5RC

>'real' distances, .ie >line-of-sight ?

Lots of folks are working on lots of stuff, but our group is on the verge of building a MAN (metropolitan area network) and links using Kantronics D4-10 UHF radios running at 19.2kb. We had 8 of the radios on order since last June, and they finally arrived last week, so we're now starting to get things built.

The Kantronics radios are 10W, 2 channel, crystal controlled radios designed for digital data. They have a standard narrow, or wide 60KHz, bandwidth, and a TTL-level I/O port on the back panel. In our system, we're not even using modems, but rather shoving TTL level HDLC frames (generated by an 8530-based plugin card, or by a Kantronics DataEngine) directly into the radio. In our testing so far, it works fine -- we've seen throughputs on the order of 1700 cps using ka9q's ftp services.

Our initial step is to build a digital repeater out of two of the radios, and we hope to have that running in test mode by the weekend. Then, we'll hook the repeater up to a DataEngine running as a BPQ switch to do the interconnections.

As the project progresses, we'll post updates here.

Thanks for the apology, Aaron. And, yes, Sorgatz was a monumental jerk in his reply to Rob. He dosn't represent the true amateur spirit; in fact, he has little resemblence to *anything* I've seen or experienced in amateur radio. Such people leave a stain in the ether...

But, I wanted to point something out: I've worked lots with the FCC Field Office in Denver and I can *ASSURE* you that they have the ability to find anyone, on any frequency, that they choose. What's more, you won't be able to identify the enforcement vehicle without taking a good, long peek inside. We don't see them much because they're busy with all sorts of other services, but if they got the word to "go after" pirates, they'd be able to find 'em quite effectively.

According to an article published in _Radio-Electronics_, the
FCC does not regulate the use of frequencies below 9khz.

3330. Great Circle calculations

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-02 17:12:25 UTC
From: kb2glo@cbnewsj.cb.att.com
Message-ID: <1991Oct2.171225.10964@cbnewsj.cb.att.com>
Source record: 292892

I've had a program I've used for calculating Great Circle distance
and it seemed to have worked fine. However I just noticed a bug when
it's computing distances between locations in the Northern Western
hemisphere and the Southern Eastern hemisphere... Maybe somebody out
there can point out the error or a better equation. Any assistance
would be appreciated. The ouput of the program is as follows:

```
Distance between point 1 and point 2 (nautical mi.): -2185.42
```

The program is as follows:

```
/*DISTANCE BETWEEN TWO POINTS WHEN LAT & LONG KNOWN.**************/
/* adapted from NAVPROG ,feb 1980 microcomputing */
/* 12/12/86 HJDavey */

#include <stdio.h>
#include <math.h>

#define U 57.2958 /* conversion factor to/from radians-degrees */
#define DEG2RAD(x) (x/U)

main()
{
double arcA, arcB, distance, lon1, lon2, lat1, lat2, temp1, temp2;
char dist[10];

/* Enter the lat/longs for any two points and find great circle
distance between them in nautical miles. */

/* any two latitudes/longitudes */
lon1=74.2; /* Toms River NJ */
lat1=39.9666;
lon2=-151.22; /* Sydney Australia */
lat2=-33.87;

arcA = lon1 - lon2;
arcB = lat1 - lat2;
temp1 = cos(DEG2RAD(lat1)) * cos(DEG2RAD(lat2)) *
cos(DEG2RAD(fabs(arcA))) + cos(DEG2RAD(fabs(arcB))) -
cos(DEG2RAD(lat1)) * cos(DEG2RAD(lat2));
temp2 = atan(sqrt(1 - temp1 * temp1) / temp1);
distance = temp2 * U * 60.0;

printf("Distance between point 1 and point 2 (nautical mi.): %7.2f\n",
distance);
}
```

Thanks and 73 DE KB2GLO, Tom.

You're giving MLS way more credit than it deserves.
With a properly equipped plane and specially trained crew, the current
system (ILS-Instrument Landing System) can be used with no visibility
at all. It's called a Category 3-c approach. I don't think
any are actuallly implemented, though, because nobody'd be able
to get to or from the airport in those conditions...(Oh, and also,
the approach, touchdown, and rollout have been worked out,
but they haven't been able to figure out how to get the plane
from the runway to the gate yet with no visibility!)
MLS is expensive and controversial--it's only clear advantages are
that it takes less real estate to install and it can implement
curved approaches, which are needed at a few mountain airports.

>many major US airport apparently don't have it yet. In fact the FAA is
>not only behind the times on the equipment they require, they are way

Maybe not. Microbursts can develop so fast that Piedmont may well have
had no choice but to continue.

Ok, it seems that none of you share my opinion that college kids should be able to read and research such a trivial thing as building a Part 15 device for the AM broadcast band. No problem, this kind of response just verifies that things really are as bad as I had suspected. Let's sum up and get on with the usual activity of ham radio:

1) It's perfectly alright for someone at college level to use this group as a resource for information that could be gathered by even a cursory glance at any number of electronic hobby-oriented publications or books. Right.

2) It's not cool to flame someone for being:
a) stupid enough to blunder with a posting, even though there is the potiential that the blundering might lead to a serious rules violation or even an incursion on the Amateur frequency allocations. Sure.

b) totally unaware of the fact that there are simpler means of getting the desired information than putting a post to the entire world via the Usenet. Totally.

c) a college kid. After all, this is where our precious little ones are supposed to be learning and if you are even a little nasty to them it might stunt their growth or put them in a state of shock. You bet.

3) It's especially important to never flame anyone outside the ham hobby, because we might just lose someone who *might* have become a new ham. Uhuh.

As some of you mentioned in the caustic email you sent me, no one speaks for "this group"...fair enough. It is also fair to state that none of you speak for me. Those of you that send me negative email about my flaming this kid are entitled to your 'politically correct' notions. Items 1 thru 3 seem to summarize your feelings, I just don't agree with them! Some of you "people" wouldn't say 'shit' if you had a mouthfull. I'm a tad more honest and perhaps a little abrasive regarding that honesty.

de KB6LUY

ps-to-the fellow who looked up my callsign: Tnx fer ur gesture, Ive always wanted lid of the month! Now do you suppose you would like to explain to everyone here just how it is that you're so high and mighty as to be the one to elect me ?? ;-)

The characteristic impedance of a coax is independent of frequency, or of length. The L/C ratio (theoretically) doesn't change with frequency. Therefore, there is no "cutoff" frequency. Practically, the attenuation of the
dielectric, skin effect, resistance, limits the usefulness of coax at very high frequencies. A quarter inch section of coax still has the same impedance. That is why such care is taken to make some connectors have the right impedance to avoid a "bump" in the line. Unfortunately, most of the connectors that hams usually use do not provide a very good match at VHF and above. K9ALD.

> WHAT SHOULD THE SPACING BE BETWEEN EACH ANTENNA?

It should work fine. You can even feed all 3 antennas from a single
coax. (Pull the 20 meter dipole down and the 10 meter up, so the
feed points coincide.) The lengths interact some when you do this, so
the resonant lengths won't correspond exactly to the formula.
In other words, you'll have to do a bit of cut-and-try.

>Thanks.

Most packet is on the VHF/UHF bands, primarily 2 meters. But if HF
packet (300 baud) on 10 meters interests you, the HTX100 should
work fine.

It's an inexpensive, but perfectly functional 10 meter SSB/CW rig.
It doesn't have a narrow CW filter, so I wouldn't count on it in a
contest, but it works fine for casual CW contacts.

By the way, they can be bought used for $100-$150.

If the line is terminated in a 50 ohm load, then the input to the line
looks like 50 ohms no matter how short (or long) the line is. If the
line is terminated in anything other than 50 ohms resistive, then the
input will not be 50 ohms resistive no matter how long the line is
(for periodic signals and ignoring line loss.)

I thought the supreme court said it
was perfectly legal to listen in on
cordless phone conversations.
It was a case where sonmeone heard
on a baby monitor that the guy across
the street was raping a 6 year old or
abusing her or something.They recprded
him and turned it in to the cops and
he was arrested.
Someone correct me if I'm wrong,but
I think that's how it went.

This may be a stupid question and I'm
not challenging the FCC or anything,but
is there someone sitting around 24 hours
a day listening to every frequency to
see if someone is pirating on it?
How do they tell anyway,just by someone
saying their call sign before anything
else?What is to stop someone from making
a false call sign?

Also,I was told of a license where you
do not have to know morse code to get
it.What exactly do you have to know
and how uch does it cost to get this license?
Thanks
Rob

This Is The Year Of The Bunny!!

3340. College net tonight!

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-02 20:13:38 UTC
From: tucker@bombay.eedsp.gatec.edu
Message-ID: <1991Oct2.201338.3589@eedsp.gatech.edu>
Source record: 292915

Hello, all! Following weeks of talk about a college net, I'm going to
do something brash and just call one. Tonight! So, here's the scoop:

I (W4AQL) will call for all college stations tonight (Wed. 2-Oct) on
two bands. We are located in Atlanta, GA.

0100Z 21.255 +QRM (moving up for QRM)
0145Z 7.205 +QRM

For those of you that live and breathe GMT, that will be Thurs. morning
GMT.

Have a listen. We have 1.5 KW on both bands, a tribander for the hi bands
and a 2 el. beam for 40m. I will be looking for a west or north station
to help with net control on 15m. 15m might be closed by this time, in
which case, just try for us on 40m at 0145. If anyone has a problem with
both these, they can email me and we can try a sched on any other band.
However, I do not anticipate calling for general checkins on other bands
tonight.

I hope to see you there. I feel like this has been talked about too much
and acted on too little. I picked tonight because of my schedule. If
there is real interest in doing something different, we can try that next
week.

By the way, it might be interesting to know that I used to live with
Jon Ogden, KE9NA, one of the persons who started the original college net.

You'll be even better off discarding the Icom dummy loads and buying a
Comet or Larsen dual bander ducky. Both of these are far superior to
the factory antennas. The Comet *is* a little on the long side for a
small radio, but antennas approaching a resonant length *do* work
better than short fat little ducks.

I would like to respond to this point by point.

Aaron Matthew Barnes writes (obscenities/profanities deleted):

> I think what we have here is an issue of using free space.

This is not an issue dealing with occupying space.
It is an issue of transmitting on the airwaves.

> Who is anyone to tell me which air I am supposed to brethe?

Why is this an issue at all? How does it relate to building or using a
transmitter or receiver?

> In the same fashion I dont take kindly to being told where,when,
> how, and how much to transmit.

The federal government has enacted the "Communications Act of 1934", which
regulates who may operate any transmitter, and delegates the authority for
regulating the radio waves to the Federal Communications Commission (FCC).
In turn, the FCC has promulgated rules specifying frequencies, modes, power
levels, licensing and operating requirements for all non-government stations.
Compliance is required for all persons under the jurisdiction of the United
States. Penalties include prison terms, fines, and confiscation of equipment.

Some bands have been left at least partially open by the FCC.
These include a part of the VLF band and all of Citizens Band. I do not believe
that a license is required to operate a transmitter in either of these
bands, although there are restrictions on antennae and the amount of power
which may be used. Also, there are "Part 15" devices, which are specially
certified low-power devices that operate on many different
frequencies, including the AM and FM broadcast bands. The
use of "Part 15" devices does not require a license. The use of light
waves is not regulated as far as I know.

The law is not open to whether or not each of us agrees with it personally.
If we don't agree with it, we are still bound by it. We may work to
change it within "the system". But if we break the law, then we will
pay the price.

> The airwaves are in the PUBLIC DOMAIN.Nobody owns them, so liscens
> or not I will transmit where I want.

The airwaves are not in the public domain. The government owns them.
For a private person inside the jurisdiction of the United States
to transmit in violation of the FCC regulations is against the law.

Hams are serious about keeping unlicensed persons (called "bootleggers" or "turkeys") out of the ham bands until they have a valid license. Hams are organized via both the Intruder Watch system and the FCC Amateur Auxiliary to identify, report, and follow through on serious problems in this regard. There have been many successful prosecutions.

An unlicensed person transmitting in the ham bands is at a distinct disadvantage. Most do not know the lingo or what is a valid callsign. If they chance upon a callsign that sounds correct, the first person who tries to send a QSL card to acknowledge the contact will discover that the call is phony, because there is a database of all the correct ham calls.

Once an unlicensed person is identified, his location can be easily triangulated by other hams who can get the location down to which house on which street. Getting a directional reading from a properly equipped station can be done in about one second. With 450,000 hams, the chances are very good that there will be several waiting for you in Cleveland. Then the FCC is called in, warrants are sworn, and the perpetrator(s) arrested.

My bottom line is that I suggest that you refrain from illegal use of any transmitter. If you insist on transmitting illegally, I suggest you stay out of the ham bands. If you are the next bootlegger, changes are that you will be caught. You will be prosecuted. You will be punished.

> And I suggest all of you with 20m masts up your ### to #### off.

I do not own a 20m mast. So this does not apply to me, right?

> Maybe this discussion of freedom should be discused in another
> base, but I would like to say something in the defense of Rob, who
> has to pretend to be an enthuiast just to keep from getting the
> amateur ###holes ###### off.

Perhaps it should be moved to another base. My personal preference is that if people do not wish to move it, could the obscenities, profanity, etc. be stopped at least.

> Some of the hams are okay, but the ones that hang around in the FCC
> zombie club should go to a communist country if they want to be
> controlled by a bunch of fat cats sitting in a high rise.

Why do you say that this is only happening in a communist country? Where have you been?

>the Noise Limiting of the 735 vs. the Noise Blanking of the 450.
>I have no idea of the pros and cons of Noise Limiting vs. Noise Blanking.

I hear the TS-450 is a good radio, but haven't used one. I own the IC-735 and think very highly of it. This is an excellent performing radio in a remarkably small package. In particular the thermal design is praiseworthy. This radio will operate keydown for extended periods of time without over heating. The receiver is first rate with excellent overload characteristics and good filtering. The noise limiter is actually a variable threshold *blanker* and will work on both ignition type noise *and* on wider signals like the woodpecker. (Has anyone heard the woodpecker lately?) Bang for the buck, I think this is the best HF rig on the market. It just feels right. If you plan any mobile operation, you *must* look at this radio.

>Disclaimer: Everything I said is of my own opinion. Not my employer's. :)

Just as an added information. The Japanese local sale version of the FT470
called FT-728 is fully capable of receiving from 800-950Mhz. So far I've
had a number of different radios(HT's) and the only difference between
Japanese local and export versions are cosmetic and a jumper or a diode that
determines whether it's a local or export version(This is normally done on the
control side of the rig, and the RF side is identical). I have a feeling
that the mod that was done is different from the one that I have. The one
that I have describes a number of jumpers that has to made rather then
removing a surface mount resistor.

>hams usually use do not provide a very good match at VHF and above. K9ALD.
>
While this is true, it is also true that a section of line may or may not
behave as a transmission line depending on line length and frequency of

the signal in question. A perfect example is the application of a DC source to a 50 coax line. After the transient has settled (which is the only time you will see Tline behavior in this particular setup) the line's impedance will be identically equal to the DC series resistance of the line which is a whole lot less than 50 ohms.

In order for you to be able to have a line act as a transmission line, you must have a situation where there is enough of a wavelength impressed on the line so as to sustain a voltage and or current gradient along it's length. If you don't have this situation, then everywhere along the line the voltage and current are equal hence the line acts as a lumped element.

Read this carefully: I am not suggesting that there is a frequency dependence associated with the characteristic impedance of the line (at least not to a first order), but I am suggesting that the frequency of the signal in question and the length of the line in question determine whether or not the line behaves as a lumped circuit element or as a transmission line. Six inches of RG8/U operated at 1mhz is a shielded wire only. While six inches of RG8/U operated at 10 gig is a T-line whose characteristic impedance will very much be seen by the circuit driving it.

This is a commonly confused subject and it is worthwhile spending some time looking both at transient and steady state cases to really gain an understanding of the phenomena. I like the Motorola MECL Systems Design handbook as a source of information for transient analysis.

3347. Re: Plans for small transmitter/receiver

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-02 21:27:22 UTC
From: jfw@ksr.com
Message-ID: <5714@ksr.com>
Source record: 292906

ah157@cleveland.Freenet.Edu (Rob Henry) writes:
>This may be a stupid question and I'm not challenging the FCC or anything,but
>is there someone sitting around 24 hours a day listening to every frequency to
>see if someone is pirating on it?

Most cases the FCC investigates start with a complaint of Radio Frequency
Interference. Some regions of the spectrum get actively monitored as they
are popular places for pirate stations.

>How do they tell anyway,just by someone saying their call sign before anything
>else?What is to stop someone from making a false call sign?

Nothing, but the know the location of the real station with a given callsign,
and it is rather easy to determine the location of a transmitter. It's all
a question of how badly they want to find it.

>Also,I was told of a license where you do not have to know morse code to get
>it.What exactly do you have to know and how uch does it cost to get this
>license?

There are several licenses where you don't need Morse Code, but if you want to
construct radios, then you want the Technician Class Amateur Radio license.
The test covers electronics, radio propagation, and FCC regulations. The
test isn't hard, and the cost is nominal (something like $5, I don't know
what it is now) (that's the cost the amateur test-givers charge, the license
itself is free, as (of course) are renewals). The Technician license gives
all amateur priveleges above 50 MHz (you can also take the 5WPM code test to
get Novice HF (below 30MHz) priveleges). As I said in mail to you, you can
ask the American Radio Relay League for the prospective ham information, at

ARRL
225 Main Street
Newington CT 06111

Your local Radio Shack will also have study guides for both the Technician and
Novice classes (I don't know how their materials are structured, you may need
to buy both, since the amateur tests are layered: Technician class is a test
which is added to the Novice test, etc).

It also serves another more important purpose of getting the user to
speak at the proper level. The user will speak at a level that tends
to match his sidetone level to the level of the incoming caller. This
is designed to be the ideal level for the network.

> Rob regulations (law). It costs about
> -- as much as a lunch would.

If you are much brighter than your earlier intemperate response showed,
you should be able to pass the exam with only a couple weeks of serious
study. The paperwork takes about six weeks to wend it's way through
the various places. If you stop by your local Radio Shack store you
can pick up a study guide and be a legally licensed amateur radio operator
two months from today. You will not need to pirate the airwaves you will
be entitled to a part of them.

As you have may have discovered, the amateur radio bands are in much
better condition than the Citizens Band. This is due to in large part
to the amount and type of self policing. We are rather protective of
"our" piece of the electromagnetic spectrum. Jealously so. Those that
abide by the laws are welcomed as brothers (and sisters). Those that
don't ... well, they don't last long there. If this bothers you then
perhaps you really need to look into leasing some commercial band equipment.
If not then why not look into getting a license? I think it's a great
hobby. The start up costs are higher than basketball, but the continuing
costs are lower than bowling. The folks are (usually ... there are some
fatheads) congnial. You get out of it in proportion to what you put
into it.

SPECIAL NOTE: It has come to my attention, directly and indirectly, that this list is being reprinted and/or summarized in other newsgroups and electronic forums. I really don't mind this, but would appreciate advanced coordination. This will allow me to keep tabs on its distribution, monitor inappropriate uses (i.e. use for profit or as part of a copyrighted work), prevent duplication of effort, and maintain version control and accuracy everwhere it appears. If you would like to become an "official" distributor of this list to another forum, send me E-mail, and I will send you the latest copy each month. The following is a list of "official" distributors. If you are reposting this directory and are not on the list, I would very much like to hear from you.

Newsgroup/Forum/Archive	Submitter/Moderator	E-mail address
comp.archives	Ed Vielmetti	emv@msen.com
news.lists	Gene Spafford	spaf@cs.purdue.edu
Compuserve Hamnet	Scott Loftesness	sjl@glenbrook.com
ftp.cs.buffalo.edu	Devon Bowen	bowen@cs.buffalo.edu

A Brief Historical Overview:

If there is any one constant in the changing state of the communications art, it is that "hams" have always been on the forefront of it. Rumors abound where the term "Ham" came from. Some of the more amusing include:

the acronym "Home Amateur Mechanic" or...

from the Cockney pronunciation of "L'amateur" or...

the initals of the founder of the American Radio Relay League, Hiram Maxem, W1AW (his actual middle name being Percy apparently notwithstanding) or...

from the call letters of one of the first amateur stations at Harvard, H.A.M. (please, no flames from W1XM at MIT)

Knowledgable individuals from the ARRL, and other radio historians, seem to agree that the terms "Ham" and "Lid" (an inept operator) both originated with landline telegraphy. A "Ham" was a show-off and a "Lid" was a telegraph operator so inexperienced, he had to use a pot or can lid to rest his telegraph sounder on to properly copy the code.

Regardless of origin of the name, a "Ham" is universally recognizable as one who experiments in radio and communications.

Whether it be constructing a low-power CW radio with vacuum tubes, or designing TCP/IP packet networks, such experimentation has historically spilled over into the mainstream such as was the case with Edwin Armstrong, who developed the regenerative oscillator and FM radio, or General Curtis LeMay (K6LEW) who was instrumental in making Single-Sideband the communications standard for the Strategic Air Command and eventually the U.S. Air Force. Although packet-switching techniques originated from DARPA (Defense Advanced Research Projects Agency) and the ARPANet, no one can deny the trememdous influence that amateurs have had in demonstrating the viability of TCP/IP and AX.25 communications via radio links. The efforts of AMSAT (the Amateur Satellite Corporation) including the development of many ham satellites and the low-orbiting Microsats (communications satellites no bigger than a breadbox that use store-and forward packet techiques) has certainly "advanced the state of the communications art," one of the defined purposes of the Amateur Radio Service, as recognized by international treaty.

Since in many cases hams are writing "the book", there is often no "book" or other established reference for a beginner to refer to. Traditionally, information has been passed on from ham to ham via word-of-mouth. Like many of the traditional crafts, a variation of the Master-Apprentice system has emerged, the Elmer-Novice relationship. Called "Elmers" because they are usually older and wiser, having the benefit of many years in the hobby, including several failed projects, and an electric shock or two, they have traditionally been the mainstay of the hobby, and the source of many new hams, particularly those interested in working on emerging technologies.

What is an Elmer today?

An Elmer today is of any age, male or female, who has some expertise and is willing to share it with beginners. Elmers don't even need to be licensed amateurs, just people with knowledge in some area of electronics or communications technology.

What is a Usenet Elmer?

With the ever-widening scope of the Internet, and the amateur radio newsgroups on Usenet, the potential for Elmers to share their information to a wide audience has never been greater. To that end, I have started to maintain a list of such Elmers. Volunteers need only send me their name, E-mail address, and area of expertise.

Naturally, the more that volunteer, the more the work is distributed. If upon volunteering, you are unable to meet your obligations, simply write to me and I will remove your name from the list. I could also add that because of "personal committments" or "career broadening" you

no longer are available to Elmer on a regular basis.

I will be the point-of-contact for this project. I will maintain the list, post it to the groups on the first of each month, and have the latest copy placed in the supplemental archives at ftp.cs.buffalo.edu in subdirectory ~/pub/ham-radio.

Those desiring a more extensive list, or who need more specific assistance, are encouraged to contact Rosalie White, WA1STO (no arrlhq.UUCP mailbox yet) at the American Radio Relay League, 225 Main St., Newington, CT 06111.

The latest version of the list can be found in the companion posting to this message, "Monthly Usenet Elmers Resource Directory." If you sent me mail and are not on it, please resend as it may have been lost on the way or once it reached my host.

Currently, the list is over 30 Elmers strong, has been featured in informational postings in the comp.archives and news.lists newsgroups, and has become an invaluable resource for many, as well as an opportunity for the volunteers to share their knowledge. Thanks to all the volunteer Elmers, as well as courteous list users, for making this service a success.

I can provide advice & assistance to any hams (or prospective hams) who might be interested in things like reciprocal licenses, the differences between European and USA Bandplans/operating practices etc.

Similarly, where to go in Britain to take ham tests, how to get information on joining RSGB or local radio clubs, details of hamfests/swapmeets etc. over this side of the pond...

Also advice on old tube-type radios (from the 1940s to the 1960s) and 'low budget' radio - converting commercial VHF 2-way dispatcher radios to work on packet etc.

In Rich's letter of 26 Sep 91 17:24:33, He writes...
>I recently saw some ads for NCG antennas in the latest issue of QST.
>One of the antennas in a nearly 18' dual bander which has a fiberglass
>housing and has many 5/8 wave elements stacked. Anyone out there have >some
experience with this antenna ? How does it compare with the >Diamond X-500 as
far as quality and performance ??

Hi Rich,
I had just recently purchased my Comet CA-244 MAX (about 4 months ago), which is the 2 Meter, 70 cm Base/Repeater version Fiberglass Vertical version. It is in three sections and is very easy to assemble (Each junction has a sliding berillium copper coupling that joins the center elements together that uses two SET SCREWS that you tighten down. You then slide the upper antenna Fiberglass section into the lower section and slide the outer Black plastic coupling over the lower female Black Plastic coupling and twist it tight. There's a O-ring that is included in each coupling to form a weatherproof seal also. That makes assembly of the antenna go very quickly and there's no tuning provision- the antenna has been pretuned at the factory. I found my antenna's SWR range to be fairly flat on both bands at 1.5 to 1. The antenna has 3 ground radials that are approximately 14 inches long and those are solid metal and they thread into the lower section and lock-down via Hex nuts and lock washers. The lower section also comes with a vertical mounting type clamp in which the antenna slides into. You would need to thread the coax through the mount/tube from the bottom-up. The mount/tube also shields the coax connector which is a SO-239. The mount/tube has a side bolt that locks the antenna assembly to the mount. I clamped my antenna to the Vent Pipe which ended-up being the right length for the clamping assembly on the highest roof peak on my house which puts it at approximately 50 feet up to the bottom of the ground radials.
Now as far as the performance claims, I would tend to agree with them. They claim about 8.5 db on 2 meters and 11.5 db on the 70 cm band. I made a power reading comparison (the repeater I used, has voice S-reading) between the Comet CA-244 Max and with my stock rubber duck antenna on my Yaesu FT-470 standing on the roof, next to the antenna. At low power on 7.2 volts, I got a S2 reading on my rubber duck. On the Comet CA-244 Max, I got S9 + 40 db... This was on the 2 meter band. that I tried this test on. I didn't try the 70 cm band yet, but I would tend to believe it would be even better. As far as performance-wise, I'm able to hook-up with San diego Repeaters to the south and all repeaters on the west and to the east as far as I can tell. I live in Montebello, which has hills and the MOuntain Range to the north, but sometimes when conditions are right, I can hook-up to the repeaters in Palmdale. I can also use Simplex to San Diego no problem also. I haven't tried the Diamond X-500 myself, but two of my friends have just recently installed their Comet CA-244 Max's and they are very happy with theirs too, just as I am. One thing though, you should mount this antenna as high as possible because of it's high gain, because it will

pick-up RFI from below if you're not careful.
I hope my contribution will help you decide on which antenna to get, Rich.

3357. pirates on 10m

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-03 01:22:21 UTC
From: oo7@ut-emx.uucp
Message-ID: <58462@ut-emx.uucp>
Source record: 292916

I was listening around on 10m the other day and came across a couple of bozos using LSB on 28005. They were exchanging addresses so as to send each other QSL cards. No callsigns, lots of 'CB language' (although you hear some funny stuff from licensed hams on 10m these days - but I digress...). One of them was extremely loud and gave his address in Jamaica (the country, not NY...), and must have been running a lot of power. The other one was in Maryland (which city has zip code 21740?), I could barely hear anything except that the 6Y guy obligingly repeated the address (I have the street address, the state and the zip - missed the city while I was decreasing the receiver gain in a vain attempt to reduce his distortion).

Realistically, is there any point whatsoever in my spending money on stamps to report these lids to anyone? Anyone dumb enough to go on the amateur bands with a CB and then give their address over the air is probably dumb enough to electrocute themselves with their illegal amplifier, so should I do nothing and encourage them to stay on the air so that this has a chance of happening?

Does the FCC really care? Would their equivalent in Jamaica, either? Has anyone here reported such cases, with actual addresses, and got anything more than a polite "Bug Letter #12" from the FCC?

Or should I do what some people on this net suggest, and send them the ARRL 'how to become a ham and thus turn into a useful citizen' package? (rrrrright...).

I suspect that a direct letter to the offenders might have a small effect, but nothing else is likely to. I could post the addresses here in case anyone else wants to send hate mail.

But then, as a local ham said, "why bother?"

/\

SOLAR TERRESTRIAL BULLETIN

02 October, 1991

MAJOR SUMMARY OF TOTAL ELECTRON CONTENT
FOR SEPTEMBER 1991 NOW AVAILABLE

/\

MAJOR SUMMARY OF TOTAL ELECTRON CONTENT FOR SEPTEMBER 1991 NOW AVAILABLE

The major summary of hourly Total Electron Content (TEC) for the month of September 1991 is now available for anonymous FTP from: solar.stanford.edu in the "pub" directory. The file to get is: "tec-summary-sept.zip". You may also obtain this file via anonymous FTP from nic.funet.fi.

This report comes in two parts (two files representing the two parts are contained in the ZIP file).

The first file contains the hourly tabular TEC data for seven western and four eastern hemisphere stations. It also contains charts of the monthly mean for each station. This first file is 21 pages in length.

The second file is a comprehensive summary of hourly TEC data for each of the eleven stations in chart-form. These charts were originally included in with the tabular data, which made the overall file excessively large. The file has since been split into the two parts separating the tabular data and the daily charts, which should make things easier to manage. This second file is 136 pages in length.

The compressed ZIP file is 52K in size and should therefore be quite painless to FTP. Use "unzip" to extract the files.

Hi Ed,

I'm glad to see the ARRL on the net here and I'd like to thank you for the informative things that you've contributed to this forum. I don't know how familiar you are with USENET, but one of the common blunders we hams make on the net is to be too verbose, especially in our .signature files. There is a lot of good information in your .sig file, but a net convention is that 3 to 4 lines is considered a reasonably long .sig file. Please note that I'm not flaming or criticizing you. (I've been toasted several times for suggesting that 14+ lines is too much for a .sig!)

Here's an idea that you might build from, but I couldn't get everything into 4 lines:

Ed Hare, KA1CV American Radio Relay League Laboratory Engineer

ARF ON THE AIR

The Amateur Radio Forum resumes its normal schedule this Thursday, Oct 03.

ARF is a current events talk show conducted on amateur radio. We are the Larry King show of ham radio. However, unlike Larry, we don't cut you off if we disagree with your point of view.

We meet from October through May on Thrusday nite at 9PM Chicago time. (0200GMT Wed)

You are all welcome to tune in to 3950 KHZ LSB on your shortwave radio. If you are not a ham, you can get on the air by dialing (312) 685 1878.

This week we will be catching up on all news of the summer.

Source record: 292910

CQ CQ CQ Home-Brew Equipment Builders ... de N4VRN

I am attempting to build a 12 volt power supply for use around the shack. Although I will probably never put this big of a load on it, I was hoping to be able to build it with a 4 or 5 amp capacity. All of the components I have purchased up to this point exceed this requirement, with the exception of a voltage regulator. The best I can do is from Radio Shack with a 1.5 amp variable regulator ... not really what I need. My only other discovery is a 12 volt, 4 amp regulator at a local electronics store ... however, it cost over $28 ... more than I really want to pay, since I have seen pre-assembled power supplies for not much more than that.

QUESTION: Has anyone seen a voltage regulator that meets this requirement for a lower price? I know I could put several lower rated regulators in parallel, but I was hoping to accomplish this with "ideal" parts.

NOTE: If the only advice is to purchase a pre-assembled supply, then I will just reduce the current capacity. My priority in this project is to build the supply as a learning experience ... the benefit of having the supply runs second.

Message-ID: <PILLERA.91Oct3072607@etd4260a.erim.org>
Source record: 293036

This gentleman brings up a good point (of if/when to report pirates on the air). I will become (assuming I pass the Technican exam next week!) a new ham, and was wondering how one could contact the FCC in situations like this.

Does the FCC continously monitor a certain VHF/UHF frequency to keep in contact with hams? Or is there simply an address that you would send a letter to?

Just curious....

3366. Low Latitude Auroral Activity Watch Cancellation - 03 October

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-03 07:21:06 UTC
From: oler@hg.uleth.CA
Message-ID: <0094F8A7.ED832980.15798@hg.uleth.ca>
Source record: 293031

/\

LOW LATITUDE AURORAL ACTIVITY WATCH

CANCELLED: 07:00 UT, 03 OCTOBER

/\

The Low Latitude Auroral Activity WATCH has been cancelled. Auroral activity peaked during the local evening hours of 02 October, after 09:00 UT. Extensive activity was observed over many middle and high latitude regions. However, the activity peaked after the moon had risen well above the horizon. This significantly hampered attempts to view activity from the lower latitudes. No low latitude reports of auroral observations have yet been received.

Activity has stabilized considerably from last nights activity and should continue to stabilize over the next 48 hours. By 04 or 05 October, only the northerly middle and high latitude regions are expected to be able to observe auroral activity, provided no other significant energetic solar events occur.

There is a continuing threat for energetic solar flare activity from solar Region 6850, which crossed the central solar meridian yesterday and is now on its way toward the western limb. It will be in a potential high-risk zone for the next three or four days. Thereafter, any terrestrial impacts produced by energetic flare activity will have a smaller impact. This region is expected to remain fairly dormant, producing only minor solar flares over the next 24 hours. However, it is easily capable of spawning an isolated major event.

** End of Watch **

3367. Middle Latitude Auroral Warning Downgraded to a Watch - 03 October

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-03 07:52:34 UTC
From: oler@hg.uleth.CA
Message-ID: <0094F8AC.5289C100.15961@hg.uleth.ca>
Source record: 293053

/\

MIDDLE LATITUDE AURORAL ACTIVITY WARNING

DOWNGRADED: 07:10 UT, 03 OCTOBER

/\

MODERATE RISK PERIOD: 03 October

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: LOW - MODERATE

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: >55 North Latitude

POTENTIAL LUNAR INTERFERENCE: MODERATE

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: FAIR

Auroral activity has stabilized considerably over the last 18 hours and is presently only visible over the northerly middle and high latitude regions. Stabilization will continue over the next 24 to 48 hours. By 04 or 05 October, activity should be confined to the high latitude regions.

There is a chance for isolated substorm periods which might enhance auroral activity significantly over localized middle latitude regions. However, this activity is not expected to be nearly as widespread as the activity which was observed last night (02 October). Unless another energetic solar event erupts, activity should continue to diminish over all regions.

** End of Warning **

3368. Who is dumber?

Our Division was recently sold to Computer Sciences Corp. I am looking for
CSC Hams on the net to see if there is any formal group within CSC.

Thanks,

Bill

3370. Re: Needed: Kenwood TH-26A and TH-46A Mods

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-03 12:50:26 UTC
From: aviator@athena.mit.edu
Message-ID: <1991Oct3.125026.22682@athena.mit.edu>
Source record: 293035

What follows below is the most extensive description of TH-27A mods
that I have ever seen. Sorry about the ALL CAPS, it came that way.
I've performed the "snip-the-green-wire" mod on mine in order to be
able to use it for the Civil Air Patrol. Works great. ...Joakim

---- Cut here ----

The following info on the TH27A was posted before, just after Christmas,
and is reposted due to recent queries. Please respond directly to the
author, Tom, at Internet: N5OFF@W5DDL.AARA.ORG,
Packet: N5OFF@K5ARH.#LFTLA.LA.USA.NA

I HAVE BEEN DOING SOME EXPERIMENTING WITH MY TH-27A, AND HAVE
FOUND IT TO BE AN EXCELLENT AIRCRAFT RECEIVER AS WELL AS A FINE
TWO METER TRANSCEIVER. IT WILL ALSO DO FULL 136-174 MHZ TX/RX,
BUT I HAVE NOT YET FOUND A MOD CONFIGURATION THAT WILL ALLOW
FULL TX/RX AND AIRCRAFT RECEIVE AT THE SAME TIME (EXCEPT THE
ASIAN CONFIG, TH-F27, WHICH I WILL DESCRIBE BELOW).

WHEN MODIFIED FOR FULL 136-174 TX/RX IN ANY OF THE WESTERN CONFIGS
THE AIRCRAFT AM IS DEFEATED (SEE CHART BELOW). IN THE ASIAN CONFIG,
THE RIG BECOMES A VERSATILE WIDE BAND RECEIVER 118-174, 200-400 (DISPLAY
ONLY) AND WILL TX 136-174. THE PROBLEM WITH THIS CONFIG IS THAT SOME
OF THE KEY POSITIONS BECOME RELOCATED (SEE CROSS REFERENCE).
THE KEY DIFFERENCES ARE OBVIOUS IF YOU COMPARE A JAPANESE
KENWOOD BROCHURE WITH A YANKEE ONE.

SO, CAN ANYONE OUT THERE SHED SOME LIGHT ON HOW TO GET FULL
136-174 TX/RX AND PRESERVE THE RELATIVELY HIGH QUALITY
AIRCRAFT RECEIVE PRESENT IN THE WESTERN STANDARD CONFIGURATION?
I HAVE INCLUDED BELOW MY SUMMARY OF THE POSSIBLE RESISTOR
COMBINATIONS, ALONG WITH A PARTIAL RESULTS LIST.(DID I MISS
A RESISTOR SOMEWHERE?)

TH-27A TO TH-F27 (ASIAN VERSION) KEY RELOCATIONS

TH-27A KEY = TH-F27 KEY

TONE/TONE SEL CALL/C-SCAN
CALL/C SCAN BELL/STEP
3 TALT 3 TONE
SHIFT/REV REV/SHIFT
MHZ/STEP MHZ (NO F FUNCTION)

I HAVE SETTLED ON THE ASIAN MOD FOR MY TH-27A, AND FIND THAT
THE BUTTON DIFFERENCES ARE EASY TO LIVE WITH. ALL FUNCTIONS ON THE
RIG SEEM TO WORK IN THE ASIAN CONFIG EXCEPT I DON'T THINK THE
AUTO-DIALER WILL DIAL A * OR #. NO BIG DEAL FOR ME. IT WILL MANUALLY
SEND A # OR * THOUGH.

AS STATED EARLIER, THE COVERAGE OF THE RIG IN THE ASIAN CONFIG IS

118-136 AM RX (WITH A REAL AM DETECTOR)
136-174 FM TX/RX
200-400 RX

I DON'T THINK THE 200-400 WORKS AT ALL BECAUSE I'VE COMPARED IT
TO STRONG LOCAL SIGNALS ON A SCANNER AND HEARD NOTHING ON THE
TH-27A. SEE THE SENSITIVITY MEASUREMENTS BELOW.

OTHER BUTTON DIFFERENCES NOT MENTIONED EARLIER ARE:

TH-27A TH-F27
F1SEC,3 TONE ALT SOUND TONE SELECT
F MHZ STEP BAND SWITCH 118/145/340

OTHER NOTES:

AUTOPATCH WORKS WELL

CTCSS TONES SENT OK, DTMF AND CTCSS SQUELCH WORKS

BAND SCANNING, ETC WORKS OK

PROCESSORR RESET DEFAULTS TO 145.000 INSTEAD OF 144.000

TX/RX NO PROBLEM ON VHF FM

RX AIRCRAFT, GREAT! AS GOOD AS A BEARCAT 100/200, BETTER THAN
ICOM 2SAT. THE TH-27A HAS A "REAL" AM DETECTOR/AGC (SEE SCHEMATIC).

WISH LIST, FOR SOMEONE ON THE NET TO FIGURE OUT THE MOD TO GIVE
136-174 TX AND PRESERVE THE AIRCRAFT RECEIVE IN ONE OF THE STANDARD
US OR WESTERN CONFIGURATIONS. IS IT NECESSARY TO GO TO THE ASIAN
CONFIGURATION TO HAVE YOUR CAKE AND EAT IT TOO?

There are certain sub-normal characters to be found in any newsgroup. If you're using a newsreader for this group there's probably a provision for filtering out topics and/or authors that you've decided are more noise than signal. If you put 'LUY in your kill file you'll never miss anything important.

3373. Help with Satellite system problem

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-03 13:24:00 UTC
From: JMG%TNTECH.BITNET@cunyvm.cuny.edu
Message-ID: <01GBAWR7UAMOE0GAWE@TNTECH.BITNET>
Source record: 293054

Help???, Please

I know that the people who read this bulletin board have a vast knowledge of electronics amongst them. So I will try to get help on a problem I am having.

I just bought a legal descrambler for my satellite dish. I hooked it all up and everything works the way it should in that I can receive unscrambled satellite signals or switch to my regular tv antenna. The descrambler also locks on to a signal as it is suppose to, but it seems as if the satellite signal isn't strong enough for me to get the setup screen so I can subscribe to the services. This is probably the case because I notice the receiver strenght indicator is not showing any signal strength at all.

It has been suggested that the cable going from my satellite to my receiver probably needs to be replaced. Since this would involve 2 runs of about 160 feet each I would really like to check it out first. (I already spent all available funds buying the descrambler).

Do I just need to short out the ends of each cable and check the resistance (RG-6 cable) or is there a better way to check the system.

The receiver and LNAs must be working because the unscrambled signals come in real clear (and my ham radio doesn't bother them at all)

Thanks for any help

OH STOP IT ALREADY! Whether you agree with what this man sez or not, contacting his employer is an unveiled attempt at censorship. If you want to have a free forum, you must accept the fact that people will sometimes say things that you don't like.

Anyway, most of our employers would disapprove of most of our use of our network connections. So, I'd say there isn't much room for self-righteousness in the newsgroups, of any kind.

>saying their call sign before anything
>else?What is to stop someone from making
>a false call sign?

In general, the regular users of a frequency (or band of frequencies) notice illegitimate users first. Illegitimate users are fairly easy to spot; they seem to "stick out" because they do not use the procedures normal for the frequencies in use.

Bogus calls are not diffcult to spot in the amateur service.

>Also,I was told of a license where you
>do not have to know morse code to get
>it.What exactly do you have to know
>and how uch does it cost to get this license?

This is the Technician Class amateur license. It affords full amateur privileges above 30Mhz. Popular bands include 50-54 Mhz, 144-148 Mhz, 222-225 Mhz, 420-450 Mhz, and 1.2 Ghz. You'll need to learn a set of FCC rules and regulations that apply to Novice and Technician Class operation. You'll also need to learn a (disappointingly) small amount of electronic theory. You can probably find a study guide at a local ham radio related shop, or contact the American Radio Relay League in Newington, CT.

P.S. I should point out that any form of broadcasting to non-amateurs is prohibited in the amateur service. All your buddies would also need to get their licenses if you all wanted to talk at once. Otherwise, buy CB radios; it is good for at least a few blocks of range and requires no license. By the time you build a receiver/transmitter, you'll have spent more than the $50 you can buy a CB radio brand new for.

3376. Trickle charger

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-03 15:03:30 UTC
From: geb@dsl.pitt.edu
Message-ID: <11956@pitt.UUCP>
Source record: 292925
Cross-posted to: rec.radio.amateur.misc,sci.electronics

I would like to make a trickle charger for a 12V auto battery
for emergency power. I want one that will not overcharge the
battery. I have 12V power supplies, but need a circuit (with
an SCR?) to provide the auto-cutoff or taper or whatever.
Does anyone know of any? Is a 12V supply sufficient, or does
one need 15V?

Thanks.

3377. LA Times article, Mt. Wilson repeater group

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-03 15:28:56 UTC
From: price@marlin.nosc.mil
Message-ID: <9110031528.AA07089@marlin.nosc.mil>
Source record: 293057

Oh boy, just the kind of publicity we need....

Featured article in yesterday's LA Times, first page of the "View" section--all about the evil ham radio doings on the infamous 147.435 repeater (the "4-3-5 machine") in the LA area. This repeater has been a dumping ground for some of the worst things I've ever heard on ham radio, for over 20 years. And yet the FCC apparently feels relatively powerless to determine what's obscene, and night after night this thorn in our sides continues on.

The article was quite even handed, pointing out that most hams are mild-mannered technology nuts and generally abhor this type of on the air behavior. But the bottom line of the article was that for most of the crazies who use this machine, it's "fun" and for the thousands of SWLers who apparently listen to it, it's "entertaining." Great.

Any other thoughts?

--Jim, K6ZH

3378. Mods for Heath HR-1680 Receiver Needed

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-03 15:40:34 UTC
From: zmlek@dcatla.uucp
Message-ID: <4732.28eb39f2@dcatla.uucp>
Source record: 292872

I have an old Heathkit HR-1680 receiver with the matching transmitter, HX-1681. It works pretty well, but I would like to make a couple of mods to the receiver.

First, the front end is awful noisy (the meter reads S3 just from the background noise!). The October issue of 73 mentioned in passing that you could replace several diodes and an FET on the HW-9 QRP transceiver to quiet that down -- would that work with the HR-1680?

Second, the BAND switch has a "10B" position, which covers 28.5 - 29.0 Mhz. I would like to change that to 29.0 - 29.5 Mhz so I can hear the Soviet OSCARs (modes A & K). Since the HX-1681 only transmits 28.0 - 28.5 Mhz (CW), I'm not using that 10B position for anything else right now.

The schematic reveals that replacing crystal Y1 and tweaking L401 would do the job. Not so difficult! All I need is the crystal specs (fundamental or overtone, foo cut, bar holder) and a company that'll grind a custom one for me. I didn't see any crystal specs in the Heathkit manual, but I assume the crystal is some overtone type since it's over 30 Mhz.

Yeah, I know I should use mode J (or whatever the 144/440 mode is called), but I (almost) have the equipment for mode K and a limited radio budget. I either find good deals on older equipment or do without.

Send email, I'll summarize. If anyone has any opinions or information, that would be helpful. If anyone has actually made these mods, that would be fantastic!

Thanks & 73,

From: bbs.brian@doomsday.Spies.COM
Message-ID: <qF1996w164w@doomsday.Spies.COM>
Source record: 293038

Hello, I was just about to run out any buy a new ICOM 2WA, but in talking
to other ham's at work about it, I've heard that it has some problems
with receiving un-wanted garbage. I think they are intermod problems.
Has anyone had this problem, or any problems with a 2WA?

Brian

3380. 2 meter x-mit with 75 ohm coax?

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-03 15:57:00 UTC
From: horak@convex.com
Message-ID: <horak.686505420@convex.convex.com>
Source record: 293037

I finally got my Handie Talkie and have used it with my discone antenna. It seems to work great. (It doesn't get very hot :-) Two years ago I bought 75 ohm coax because I was only using a scanner with the antenna. Now that I have a transmitter, I would like to use the discone but don't want to hurt the transmitter. Question: Will I have significant problems transmitting 5 watts into 75ohm coax? and if so, what's the best 50 ohm cable to buy?

David N5OFQ

>>>(whatever that specifically means) impedance.

If the frequency range of interest is not specified, the reference is
incomplete. Complete articles on the subject will discuss frequency,
or (quasi interchangably) rise time of interest. That said, from
100 KHz on up to "microwave" (wherever one choses THAT to be), things
are fairly mellow. As noted by others, VHF requires some care.
>
> The characteristic impedance of a coax is independent of frequency, or
>of length. The L/C ratio (theoretically) doesn't change with frequency.
>Therefore, there is no "cutoff" frequency.
hrmmmm. The full equation is (from memory) sqrt(("l"+R)/("c"+j)).
where "l" and "c" are shorthand for (omega*f*l), etc. to get the units
right. As one moves above audio to the low RF, and wll before arrival
at 180M, the R and j become insginificant, allowing them to be ignored.
As one works down towards audio, they become interesting portions of the
impedance of the cable. So what are they? R is resistance/unit length,
j is leakage resistance, expressed as conductance, per unit length.
(l and r are also per unit length).

At audio, the cbale had a different impedance than at 1 Mhz, say. (In
the past, i found myself verifying this, "on the bench".) Conceptually
(no flames, please, the "impedance" of a cable at DC is infinite. The

AMATEUR RADIO EXAMINATION OPPORTUNITIES

The following test session information is provided by the ARRL/VEC for the upcoming six to eight week period. For further information, please contact the test session CONTACT PERSON at the telephone number provided. If necessary, you may contact the ARRL/VEC at 203-666-1541 x282 for additional information. Email may be sent to the ARRL/VEC at:

bjahnke%arrlhq.UUCP@uhasun.hartford.edu

or

MCI MAIL ID: 215-5052

You should include your postal address (the slow kind) in case we need to send you non-electronic material in answer to your question.

Although the test session information presented here does not indicate whether walk-ins are accepted or not, most test sessions do allow walk-ins. We encourage you, however, to always contact the CONTACT PERSON at the telephone number provided so that the VE Team is aware that you be attending the test session.

3383. PC's and RFI

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-03 16:38:05 UTC
From: SHMC0874@BCIT.BC.CA
Message-ID: <9110031639.AA03935@ucsd.edu>
Source record: 293058

From: Colin Schmutter

I use a PC extensively with radio equipment for HF fax monitoring,
VHF APT reception and other forms of digital communication.

The major problem I am facing is PC generated RFI ranging from HF to VHF
spectrum radiating into the receiving antennas.

The PC (an IBM clone) is enclosed in an all metal case and all connecting
cables are shielded.

The antenna leads are shielded coaxial cable.

Does anyone have any suggestions as to an effective cure.

Any sugestions would be appreciated.

Hi Tom,

Well, interesting you should bring this up. The currently hotly debated HR1674 includes a provision which will allow a private organization with over 100,000 members (read ARRL) to take over licensing of Ham radio Club stations. This is a class of license that FCC has been unable to issue for something like 10 years(anyone know the exact time they stopped issuing club calls?) The reasoning being that they didn't have the staff to upgrade the COMPUTER programs to deal with club licenses. In fact, they currently keep paper records of club stations and issue them by hand, that being the reason you won't find club stations in the call book.

Back in the early 80's there was a notice of rule making under consideration, PRB-3, that would have done what you were after, but there were apparently to many political problems. I guess people were worried about corruption, etc. At this point in time the only way to get FCC to open up on allowing outside organizations handle licensing appears to be through an act of Congress, thus the provision in HR1674. Perhaps another such provision should be sought...any opinions? (followups to .policy!)

3385. Re: QRP HF operation

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-03 16:40:40 UTC
From: wb9omc@dynamo.ecn.purdue.edu
Message-ID: <wb9omc.686508040@dynamo.ecn.purdue.edu>
Source record: 293039

Reference to a very interesting article on QRP HF -

Tentatively, I will be operating on 10 meters from Clingman's Dome in the Great Smoky Mountains national park between 28.300 and 28.500 mHz on November 4 and or 5th during the daytime. The rig is a Uniden 2510, unmodified with a Cushcraft AR10 vertical antenna. Real output is about 10 watts on the meter. The elevation at the operations point will be about 6400 feet above sea level (hell of a tower, ain't it???). The summit of Clingman's Dome is listed as 6642 feet, and no, I'm NOT planning on packing the stuff up that last couple hundred feet. :-(

(OK, call me a weenie - read on....)

Actual times of operation are not precisely known, since this is a vacation and my XYL will have something to say about what we do.

BTW, anyone with a 10-10 number will be encouraged to work me if possible.

While we're discussing this trip, on Wednesday, Nov. 6th, the XYL and I will *attempt* to backpack to the summit of Mt. LeConte (alt. 6593). I will be taking along my ICOM 02AT and an easily strippable, light weight antenna. Assuming that us Indiana flatlands folks make it up there without wheezing to death, I will attempt some 2-meter FM work, also QRP (with an HT? Of *course* its QRP!!! :-)). The length of time will be limited to how long my BP8 lasts - and if I can get the guts of a dead BP8 replaced before then, I'll have two. I am saving the BP3 for emergency use (well, some of the trails are nasty and it IS a bloody mountain, isn't it?). This operation can be assumed to happen anywhere between 4PM and 11PM, I guess. I have no idea how this will work, although once I took the HT onto Clingman's Dome and heard a guy ID through a repeater in Duluth, Minnesota......

As for QSL cards - if I make enough contacts from either operation I may consider having something special printed but I make no guarantees on that - it gets expensive and I dislike charging people for a bloody card. If I just use the regular, cheap, non-descript one I will QSL 100% to contacts who really want one. My call is nothing special but sometimes people collect cards for all sorts of reasons.... :-)

I *do* wish to solicit suggestions for good frequencies to try on 2M FM - I really have no desire to interfere with anyone's repeaters, and keep in mind my license class is Technician (old), so I think there might be a couple of restrictions (I guess I better haul out that CFR47......).

>-Joe
>-----
>Joe Pillera ERIM

Hi Joe,

After seeing the previous posting, and yours I decided to call my contact at ARRL and ask the very same question. I got two answers which might help to some degree.

First, the ARRL maintains a group of folks who monitor our bands and file weekly reports with Newington who in turn files reports with FCC(I think the program is called Intruder Watch...) The FCC will file protests with the foriegn country in question about the invasion. It does some good but isn't the fastest mechanism in town. You can call Luck Hurder, KY1T an ARRL HQ, 203-666-1541 and file a report directly with him. The path should be followed when the characters in question are from out of country.

For U.S. intruders the procedure is more straight forward. Call up one of the regional monitoring stations(there are 12 or 13 of them throughout the U.S. I believe..) maintained by FCC directly and describe the problem to them. It is FCC's job to protect the amateur bands from intruders(and our job to keep licensed hams in line...thus self policing..) I've had occassion to make the call myself and found the engineer at the monitoring station to be more than helpful.. The problem turned our to be located some where off the coast of Peru so there wasn't much that could be done that time, but if you called up and got them to listen to someone giving their address out over the air and get it on tape.... That is a whole different can of worms... and likely to get some

positive action.

Hope this helps.

3389. Swan Users' Group & Net

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-03 17:27:42 UTC
From: furr@pilot.njin.net
Message-ID: <Oct.3.13.27.42.1991.20493@pilot.njin.net>
Source record: 293040

There are lots of old Swan tube-type transceivers still around. Fewer and fewer people who are not technical know how to repair, troubleshoot, and maintain them.
I have an advertisement in the latest QST to form a Swan Users' Group. If you are interested, please reply by mail to that ad. Do NOT send mail here, as I request a SASE.
There is also a Swan Users' Net on 14.250 MHz at 2100 UTC (it may change one hour when DST comes in; it's run at present on 2 p.m. California time). There are ECoast and WCoast net controls, and it should be easy to get on it no matter where you are. Apparantly this group does have a newsletter, too.
Those who send me the SASE will get repair, troubleshooting, etc. info when I've put a substantial amount together. Let's hear from you.

Ok all of you dedicated tattle tales
out there.Wanna hear a good one?
Ever hear of how to take a Mr Microphone
and make an FM station out of it.I
just found out and may even try it sometime.Just so you know
everyone isn't as stuck up as some of
you.What is the real harm in
broadcasting AM or FM for 3 blocks?
As long as no commercial staenlighten me here,what s the real harm?

All of you HAMS are getting pissed off
for a reason that is unclear to me.
If you read attentively,you saw i asked
for AM transmitter plans.None of you
transmit on 550-1650mhz unless you
own your own commercial station.I don
't care what kind of license you have
or how big your antenna is.
So why doesn't everyone here
just take a pill?I'm not going to
take over the airwaves of america with
a vacuum tube run, .000001 mw transmitter
.If you're all pro's like you claim
to be you could have figured this out
without wasting all of the bandwidth
you already have by flaming me and
giving me all the rules on.

This will solve your sign problem!

If you want a version of this program where it ask for the longitude and
latitude of point 1 and 2, I will send you one. It won't be necessary to
recompile everytime. Thanks to Georges E. Desrochers our mathematician
who solved that in 8 seconds flat.

Regards, Clem.

3393. RACES Bulletins

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-03 18:37:15 UTC
From: enge@almaden.ibm.com
Message-ID: <9110032007.AA04792@ucsd.edu>
Source record: 293059

I upload them to the Internet on behalf of California State OES
at their request. Archives are on ucsd.edu in hamradio/races.
This includes all bulletins ever sent.

I also send them to W3VS who puts them on Compuserve and has the
full archives also.

When these bulletins first appeared, we confined them to California
and packet. There was considerable demand from out-of-state so
distribution was started to all the US. The HF packet operators
complained that they were for California only but were shouted down by
the rest of the SYSOPs and users.

Many RACES/ARES people routinely deliver them to their served
agencies.

The conclusion is that a lot of people throughout the US wanted them
via packet and I see the same is true here on the Internet.

ah157@cleveland.Freenet.Edu (Rob Henry) writes:
>Do you think these guys were really doing any harm by talking
>on your sacred band with no call signs?

If every freebander in the whole world will get together and agree to illegally use the 10m band ONE AT A TIME with equipment that isn't overloading and splattering all across the whole 1.7MHz worth of the band, then I think I could see my way clear to ignoring them.

Unfortunately, it was those guys on that frequency, another bunch of freebanders up twenty, Chinese fishing boats up another 10, and taxi services spread through the rest of the low half of the 10m band... thousands of people, all across the world, dedicated to making life miserable for the folks who have been given the legal permission to try to use the band for communication.

Pirates jam the band dozens at a time. You DF them one at a time. Yes, they were doing harm to legitimate users of the band, and while I don't know about enforcement in Jamaica, the Maryland freebander just might get his door smashed in, his equipment confiscated, and a $1000 fine plus 2 years in jail. And he will richly deserve it. Good equipment costs so much more than the time and expense of a ham ticket itself that you just have to be fundamentally either mentally or socially retarded to refuse to do it right.

I have to make a (possibly minor) point here. Erik Sorgatz is assuming
that Rob Henry is a college student, probably at Case Western Reserve
University. I don't know Mr. Henry and don't know whether or not he is
a college student. It is very unlikely, however, that he is a student at
CWRU. His login ('ah157', I think) indicates that he is a "community user"
of a public access system here at CWRU. If he were a student, faculty member,
or staff member, his login would consist of three initials, possibly followed
by a one or two digit number and his "Reply-to" would be @po.cwru.edu rather
than @cleveland.freenet.edu. Anyway, there are community users of all ages
and all walks of life and they recently were given access to Usenet,
so look out!

Er, Rob, might I suggest that this is not a good idea. Your first posting to this forum was "please send me plans for a receiver/transmitter so I can talk to all my friends at once, I don't really care about a license". Then, Eric flames you rather crisply for displaying a certain kind of attitude.

I wasn't convinced you so much had an attitude as you were naive.

Now, there's *no shred* of doubt in my mind that you are not naive. After the flame war of the last couple days, you *know* that amateurs are required to exhibit certain knowledge in order to gain our licenses.

However, you now post "Let those illegal operators alone and report offenders who really do something bad". Can you please define what you mean by "something really bad"? As far as I'm concerned, unauthorized use of amateur frequencies is "something really bad". As far as the Federal law is concerned, it is "something really bad".

You seem to miss the point; amateurs must *earn* the privilege to operate our transmitters. It is rather like buying a piece of property for $1000. How do you feel when people start trespassing on your property, camping out, littering it up, and not paying a dime? I don't think you'd be so tolerant.

Maybe Eric was hard on you. Your recent posting now gives me reason to believe he'd spotted your attitude pretty closely. If you want respect of other people, you need to respect other people first. I'd suggest your attitude does not respect the work I've done to earn my amateur license.

You'd be better off getting you and your buddies CB sets and using that. You don't need to build a thing; in fact, I'd prefer you don't build any transmitters until you understand how they work and improve your attitude towards use of the electromagnetic spectrum.

The law clearly says otherwise, because one man's "fun" may be interfering with another's life - threatening situation, and statistically is blowing TV front ends for several blocks.

>What is the real harm in
>broadcasting AM or FM for 3 blocks?
>As long as no commercial staenlighten me here,what s the real harm?

In a word, harmonics. Most "toy" transmitters don't have the harmonic supression required of amateur gear -- nowhere close, in fact. Recall as well that electromagnetics follow an inverse square law, so that even if you're only running milliwatts, you'll have a better signal than someone who's running real power a few miles away. In effect, you're running a jammer.

>.None of you
>transmit on 550-1650mhz unless you
>own your own commercial station.I don
>'t care what kind of license you have
>or how big your antenna is.

Aside from the fact that the harmonics from such a transmitter would fall into the ham bands, where most users are doing weak signal work, "hams" get blamed for the TVI that results from such operations. So, aside from tradition there are some genuine concerns.

>.If you're all pro's like you claim
>to be you could have figured this out
>without wasting all of the bandwidth
>you already have by flaming me and
>giving me all the rules on.

If you wish to stop appearing like a fool, then you should go out and prove that in fact you know what you're talking about -- go out and get a GROL or or a ham license -- instead of wasting the time of people who already have.

NOTES:
These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "Oler@Hg.Uleth.Ca" or "COler@Solar.Stanford.Edu". This document, as well as others and related data and forecasts exist on the STD BBS at: (403) 756-3008.

3402. VHF or UHF

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-03 21:18:00 UTC
From: ciqa@mtecv2.mty.itesm.mx
Message-ID: <4298@mtecv2.mty.itesm.mx>
Source record: 293060

Hello, please excuse me if I'm posting to where the question
don't belong. Our company is going to install a radio
comunication system, we have been talking with several
radio-equipment dealers, and to our surprise, some
of they recommend us to use VHF equipment, while some
others, say UHF is absolutely superior for local (< 20 miles)
urban communications.

Who is right, VHF'ers or UHF'ers?

Thanks in advance

Jose Luis Gomez
ciqa@mtecv2.mty.itesm.mx

If your power supply has a voltage regulator, just set it at the voltage that
you want the battery to end up at, 13.6 or whatever. If there is no regulator, you can buy
one for a $ or 2 at radioshack. The trickle charger will charge the
battery up to the preset voltage and hold it there without overcharge. K9ALD

3404. Thin skinned wimps

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-03 21:28:43 UTC
From: sorgatz@avatar.tti.com
Message-ID: <30104@ttidca.TTI.COM>
Source record: 292834

In a surprise move, the tally is as follows:

negative reactions = 17
positive reactions = 23
neg on tone, pos on content = 21
real hate mail or "You're now on the kill file" = 6
threats = 2

Not a bad sample, it proves to me that at least a goodly margin of the readership here believes that college age persons should be able to use the school library. My faith is restored. To those of you that had some choice words for me...thank you! IMHO, the same applies to you! ;-)

As a parting shot to Rob, you have just encountered a firestorm, this is why I have been advocating a 30-day READ-ONLY policy for the .edu users such as yourself. I know the problem, I've been reading and contributing to Usenet since 1980; the issue of your right vs. mine is not unique.

Most newsgroups have a FAQ (Frequently-Asked-Questions) list. These are available for FTP from a number of sites, as are full article archives.

You might also consider looking at the Beginner's Net Guide.

..now could we get back to the usual discussions about Amateur Radio?

3405. Info request for Uniden 2600, coax relays

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-03 23:29:54 UTC
From: painter@rust.zso.dec.com
Message-ID: <1807@rust.zso.dec.com>
Source record: 293062

I am looking for info on mods (extended recieve, out-of-band xmit, etc...)
for the HR2600 (I hope I got the model number correct, it is the low power
10 meter Uniden radio).

Also, transverters for 6 meters.

And, I need to locate a supply for coax relays.
I need either a couple of general purpose (hf) ones, or one
that will switch between three sources but will always be connectted
from the same source to output when powered down. (ie the default rf
source)

Last but not least, does anyone make a transmatch that is small and holds
its adjustment in harsh conditions (ie. no knobs as it will be in the
trunk of my car). All of this is to allow me to use one antenna for the
cars alarm pager, and for 6 meters. I may actually GASP :-0 have to make
the last component in the rats nest.

Thanks in advance,
Tjp - N0NDO - (John Allen Painter)

3406. Extended Rx for FT-470

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-03 23:37:56 UTC
From: steve@CATICSUF.CSUFRESNO.EDU
Message-ID: <9110032337.AA03082@caticsuf.cati.CSUFresno.EDU>
Source record: 293071

I've heard rumors that there are ways to make my FT-470
receive > 450.00MHz. Specifically, I'm interested in
receiving 453.00.

Can anybody tell me how to do this, or point me to sources
of information on the subject?

Thanks.

Source record: 293066

As quoted from <30028@ttidca.TTI.COM> by sorgatz@ttidca.TTI.COM (Avatar):
+---------------
| In article <1991Sep28.143647.1128@usenet.ins.cwru.edu> ah157@cleveland.Freenet.Edu (Rob Henry) writes:
| >
| >I am an electronics enthusiast and was
| ----------------------<< Uhuh..oh, I could tell! Uhmmmm...jeez!
| (now where did I put that thermonuclear plasma torch?? Ah! Here it is!)
| FLAME ON!!
| >wondering if anyone out there has
| >plans for a small do it yourself
| >AM band or even ham band transmitter.
|
| Sure...every one of us has such plans...and if you were really an 'electronics
| enthusiast'..whatever the hell that means!..you'd have a set too..or you'd be
| in a position to know that you've asked a verrry stupid question!!
+---------------

And a hearty "Heil Hitler!" to you too, fella. THIS kind of help we don't need.

Consider, if possible, that someone may start out with an interest but no technical knowledge. (I did, but wasn't able to do anything about it.) And that they're likely to have even *less* knowledge of FCC rules. (Ever looked outside of part 97 at all?)

+---------------
| Right. You and every other jerk like you! READ MY LIPS! IF IT TRANSMITS ON A
| FREQUENCY ALLOCATED TO AMATEUR SERVICE, YOU MUST HAVE A LICENSE BEFORE YOU
| TRANSMIT!
+---------------

Just about any frequency can be used if power is sufficiently low; otherwise those low-power FM broadcast band transmitters sold by not only Ramsey but even (God forbid) Mattel would be quite illegal.

+---------------
| Like I said...what the hell do they teach you little jerks today?? Can you
+---------------

Well, it's obvious what they didn't teach *you*: common courtesy and politeness, for starters.

Somehow my own idea of a response to that article tends toward finding him an elmer. (Not me, I'm still a bit wet behind the ears myself insofar as amateur radio is concerned.)

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 029 (OPDX.029)
September 30, 1991
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn Packet Cluster Network, Southeastern Packet Cluster Group, AD1C, NT2X, WK3N, K4CEF, N5DLM, W8GMH, W8QWI and ARRL DX Bulletin for the following DX information.

1S, SPRATLY. Ed, NT2X, received a FAX from Romeo, UB5JRR, who is in Vietnam, stating the XY/3W group will be going to Spratly for 4-5 days. They found a ship that would take them there and bring them back. The callsign will be 1S0RR. UPDATE: 1S0RR became active 2300z on Friday. There were reports of activity on 7004 kHz around 1141z, 21020 kHz around 1838z and 14195 kHz around 1130 and 2326z.

4J, ARMENIA. There were two stations active on the 21335 Net, Monday, signing 4J4JJ and 4J4GO. These station are not on Malyj Vysotskij Island, but from Armenia.

FR/G, GLORIOSO ISLANDS. FR5ZU/G will be showing up any day now on the 14256 Net around 0200z.

HS, THAILAND. John, who uses the HS0AC club station now has his own callsign, HS0ZAA. QSL via KM1R.

KH9, WAKE ISLAND. Look for KH9/AD1S and KH9/WE5I operating from Wake Island from October 22 thru 30. They will be active during the CQ WW DX SSB Contest as multi-single. Before and after the contest, they will concentrate on 40 and 80 meters, with lots of CW and some RTTY with two complete stations, with beams, amps and gain antennas on 40 and 80 meters. There will be activity 10-80 meters including the WARC bands. This DXpedition is sponsored by the Oklahoma DX Association and the Oklahoma Comm Center. QSL to OKDXA, Box 88, Wellston, OK 74881 or the callbook address of AD1S.

P5, NORTH KOREA. It was reported in the ARRL DX Bulletin, that RA4HA is in North Korea attempting to establish an import/export trade and he has applied for an amateur radio license.

VK9W, WILLIS ISLAND. There has been a station signing VK9WI this week and according to Jim, VK9NS, who is the QSL Manager for VK9WI, this station is a PIRATE! Jim called Willis Island and the real VK9WI is not there now. However, VK9GS is the only active station now on the island.

Also, mentioned by Jim, look for him soon from S2-land.

YA, AFGHANISTAN. Jackie, F2CW, showed up as YA2CW on the 14226.5 Family Hour Net around 1500z and on 14256 Net around 1600z. He reported that he will be returning to France the first week in October for vacation and upon his return he will operate for about 6 months. QSL to F2CW. Also, T6AS QSL cards are now showing up stateside for those who were lucky enough to work it. This operation is good for DXCC. Reported via W2MIG Net, the entire log data from the YA operation is being put into the computer by Moscow hams and QSL cards should start coming out in about a week.

ZA, ALBANIA. (Ed. Notes: Gee! I do not know were to start with this one, because of updates (everyday), facts and new ZA stations showing up every day). ZA1A continues to be active. The DXers/Trainers have done an impressive job in giving everyone throughout the world a contact. This has to go down as one of the best organized operations ever. For being the most wanted country for DXers, the control of the pileups were handled very well. The training will continue thru October 7 and there has been some students already active on the air. There was a station signing ZA1EAB, on Thursday, who was thought to have been a student. (WFWL) Training frequencies are 14075, 21075, and 28075 kHz for CW and 14295, 21395, and 28695 kHz for SSB. New operating frequencies have been granted to the ZA1A group, listen for them on 1825, 1835, 3530, 3770, 7003, 7045 kHz and also on WARC bands.
On September 24th, two other independent stations were operating, ZA1QA and ZA1HA. Both of the stations are believed to be the Hungarians headed by HA5PP. Validation is pending by the League, because the license is reported to be signed by the Minister of Youth and Athletics, not by the PTT. It was announced by the operators of ZA1QA, on 15 meters Saturday the 28th, that they have received the proper documentation and license and would forward it to the ARRL. Activity by ZA1QA has been on or around 14214, 14035, 21300 and 28360 kHz and for ZA1HA 7010, 7054, 14005, 21230 and 28005 kHz. QSL ZA1HA to: Globex Foundation, Box 49, Budapest, Hungary 1311. QSL ZA1QA to: Quick Aid Foundation, Box 5, Comoro, Hungary 4622.
It was reported Saturday morning, on W2MIG's Net, that 3 more ZA licenses have been issued to 3 French operators. They will be active from October 6 thru the 13. One operator for sure is F6EXV and his ZA call will be ZA1ZXV. Other calls mentioned were ZA1ZMX and ZA1VX. Reportly, these are the same operators who were QRV from 7O8AA. It was also, mentioned on MIG's Net that calls being issued in Albania for foreigners will now start with the letter "Z" in their suffix. (EX. ZA1ZXV)

24 MHZ HEARD AND WORKED. (Look what you have been missing!)
3X0HNU 24944/1712z S79HX 24950/1817Z
4Z4BT 24940/1650z SV9/SV0HV 24975/1720Z
VP8CFM 24935/0038z ZA1A 24895/1230Z

STATIONS GOING QRT. 5R8JD will be leaving in November and the status of his documentation is still not known. 9L1US will be leaving the first part or the first week on October.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

3411. Re: Great Circle calculations

>there can point out the error or a better equation. Any assistance
>would be appreciated.

Tom, here's a program I wrote a while back that might be of help to you. It's in Pascal, but could easily be adapted to any convenient programming language. The equations are definitely correct.

```
Program Distance;
{ DISTANCE.PAS -- Computes distance between two points, given the latitude
and longitude of each point. Input is in degrees, minutes, and seconds.
East longitude and North latitude are assumed; negative values will be
interpreted as West and South respectively. Output includes the North-
South and East-West vectors as well as the straight-line distance, and
is given in kilometers. Results may be considered accurate to the four
decimal places displayed.

This program is legal for use in determining distances for separation
between co-channel and adjacent-channel FM broadcast stations as outlined
in FCC regulations, Part 73, Section 208(c)(1). It was written 7/13/90
by K. Scott Johnson, and is released to the public domain.
}

Type
Str30 = String[30];

Var
Lat1, Lat2,
Lon1, Lon2,
KPDLat, KPDLon,
MidLat,
NS, EW, Dist : Real;

Function GetDMS(Prompt : Str30) : Real;

Var
Deg, Min, Sec : Integer;

Begin {GetDMS}
Write (Prompt:31,' D: ');
Read(Deg);
Write (' M: ');
```

```
Read(Min);
Write (' S: ');
Readln(Sec);
If Deg < 0 then
GetDMS := Deg - Min/60 - Sec/3600
else
GetDMS := Deg + Min/60 + Sec/3600;
End; {GetDMS}

Begin {Distance}
Writeln('[DISTANCE V1.00]');
Writeln;
Writeln('Site 1 Coordinates:'); {Get Coordinates for each site, }
Lat1 := GetDMS('Latitude (North)'); {convert from DMS to decimal. }
Lon1 := GetDMS('Longitude (West)');
Writeln;
Writeln('Site 2 Coordinates:');
Lat2 := GetDMS('Latitude (North)');
Lon2 := GetDMS('Longitude (West)');

MidLat := (Lat1 + Lat2) / 2; {First, we need Middle Latitude,}
KPDLat := 111.13209 {so we can Compute Kilometers }
- 0.56605 * Cos(2 * MidLat) {Per Degree of Latitude.... }
+ 0.0012 * Cos(4 * MidLat);
KPDLon := 111.41513 * Cos(MidLat) {... and also Kilometers Per }
- 0.09455 * Cos(3 * MidLat) {Degree of Longitude at this }
+ 0.00012 * Cos(5 * MidLat);{particular middle latitude. }
NS := KPDLat * (Lat1-Lat2); {Now we multiply to get North- }
EW := KPDLon * (Lon1-Lon2); {South and East-West Distances, }
Dist := Sqrt(Sqr(NS)+Sqr(EW)); {and take the mean. Voila! }

Writeln;
Writeln;
Writeln('North-South vector = ':25,NS:4:4,' km');
Writeln('East-West vector = ':25,EW:4:4,' km');
Writeln('Straight-line Distance = ':25,Dist:4:4,' km');
End. {Distance}
```

| >No reply so far.
|
| Why do you folks think that AARL "should" object to Section 8?
+---------------

(I can't help but wonder if "AARL" is a Freudian slip... it looks an awful lot like "AARP"...)

Because most 2m FM ham transceivers cover the 150MHz band which would fall under the band... and if 150 MHz has to be chopped out 162 MHz (weather, which I find VERY useful) would also go. "Irrelevant," you say? If the cellular boys win this fight you can bet that police, business, etc. will be on the FCC and Congress to get their spectrum banned from scanners as well: 150, 450, 420-430 up here (and since the Japs aren't likely to market different rigs for "line A + the big 3", 420-430 all-mode rigs will probably disappear). For that matter, how many 6m rigs will receive the 30-50MHz business and public service frequencies? They also are at risk.

And what are the chances it'll be retroactive? The basic idea (making both reception and equipment for reception illegal) is irrational all by itself --- a paging tower near my apartment developed a problem and started spouting rectified "schtuff" on top of my radios and a neighbor's TV; if the cellular antenna goes next, will all my *AF*-manipulating equipment instantly become illegal? How about the neighbor's kid's braces? Making it retroactive is almost sane by comparison.

+---------------
| After all, it is just banning those nasty, not good for any legitimate
| use, scanners, not real amateur radio receivers.
+---------------

We should d*mned well be encouraging them to become licensed, NOT kicking them in the teeth! And if the ARRL doesn't realize this then those of us who actually kicked in and became members should be (and, in my case at least, WILL be) complaining loudly. And, of course, those who didn't join because "the ARRL's just a magazine and DXCC" or etc. get to moan about how the ARRL's doing it to us again... without a voice insofar as the ARRL is concerned. Thanks, guys. Yet again the self-fulfilling prophecy rears its ugly head.

At least the EFF has its head on straight, even if Larry Price and Co. can't see past the DXCC desk to the real danger. (I wonder if they've considered how many of their precious packet rigs for connecting to the local DX cluster have expanded RF?)

To: KB6LUY

As much as you meant to help your fellow hams, you must realize by now
that your attempt fell far short of the mark. Ignore all the QRM you
are getting for now and reflect with a close ham friend or two what
you could have done better. If you do this, most of us around here will be
glad to have a QSO with you further on down the log.

To: ah157@cleveland.Freenet.Edu (Rob Henry)

#2) If you wish to continue to try to antagnoize the readers of this
group, then I for one will do what I would do to any "jammer" I hear on the
amateur bands - I will ignore you. This will require that I finally have
to learn how to use the Kill-File feature of this news reader, but its
worth the effort to never have to see your postings again.

#3) On the other hand, if as I suspect you have an above average
interest in electronics and radio, then try to realize that ham radio is a
ticket to all sorts of interesting and challenging technologies. The
people who read this newsgroup have a vast amount of experience AND they
are willing to share this with just about anyone who can remain civil. We like
what we have earned (not bought) and have entrusted to us by the FCC and are
naturally interested in protecting it. You will probably learn at
some point that things earned are generally worth more than things bought.
If not, then see #2 and good luck.

I'm not sure what you would count as 'really bad'. They were wiping out a large patch of the cw-only portion of the band with LSB transmissions and preventing me from hearing distant stations using cw. If they had had the sense to operate in the phone-only part of the band, perhaps using USB like everyone else, I probably wouldn't have noticed them, even though they would still have been operating there illegally..

I guess this is no worse than driving a car on the sidewalk, or the wrong way down a one-way street. It does no immediate harm, but it's illegal and inconvenient for other users.

Thanks to the many people who sent e-mail with positive suggestions of ways to follow up on this.

[Radio review deleted...]
>
>AL N1AL

FYI - This'l be old news to some, but I just found out within the past month that 1200 baud packet is alive and well on 10 meters and has been for several years! I have been having quite a bit of fun with it even considering the shakey band conditions we've had recently. If you're interested, give a listen on 28,195.15 lsb with your tnc set up just as it would be for vhf packet (you'll have to play around with your threshold setting...). If you decide to jump in and connect with somebody or somenode, you'll find the following settings helpful:
retries 0 (disables excessive retries disconnect)
paclen 30 (smaller packets get through better)

Please note that this is a "ragchew" frequency and BBSing is discouraged. There are nodes, two of which I have (generally) easy access to from the east coast (Annapolis,MD,USA). These nodes are AZSE and EUTAH. From there, you can get basically anywhere in north america and probably beyound.

If you are a veteran on the freq, and care to expound on what amounts to my entire knowledge of the subject (shown above...), or you're an interested newbie looking for a not-quite-so-newbie to chat with, I'd enjoy hearing from you. Email works best, since I may not have time to "wade through the pile" here in search of your followup.

On an unrelated note:
I'm a techie class who would like to get his general ticket. Only one thing holding me up - I HATE morse code, well that's kinda strong, but lets just say I have no great love for it. I'm rusty now to the point where I would have trouble copying 5wpm! What I'm looking for is someone in a simular dillemma to comiserate with. ...Someone to practice hating code with, hi... Anybody care to travel the road to 13wpm with me? Maybe there's a bunch of us?

Interested?? Please email..... Then maybe we can have access to digital and voice on true "world bands" and not just the 10m "daytime semi-world when the sunspots are right band". I should say here that 10m has been very good to me, it just gets a little frustrating at times, when you don't have viable (or enjoyable) alternative modes/bands. Who knows, we could end up liking CW! hmmmm....
Well anyway, happy hamming and 73 de Charlie - N3HAZ

I haven't heard about that one, with the nuclear EMP protection on a military plane I rather doubt it though, unless it were a freak of some sort.

> 5W inside versus a MWatt a mile away ? More risk than I choose to take.

This is very credible. Remember radio is "square law", i.e. the power decreases as the SQUARE of the distance! When you compare a separation measured in feet with a mile or so then you can generate as intense a field quite easily.

For those who haven't done this, key up your handheld next to a flourescent light. It may have to be almost touching to ignite the bulb, but sometimes you can keep it glowing from several feet away. I have seen a 75M AM rig (200W) which kept the light at full brilliance for almost 100 yards away from the antenna.

Remember the rule for safety related items, as cited in the Challenger investigation, is "prove it CAN'T cause trouble", not "show me how it can". The Challenger disaster illustrated the folly of the latter position.

3425. Henry/Sorgatz: an observation

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-04 16:11:11 UTC
From: heacock@kuhub.cc.ukans.edu
Message-ID: <1991Oct4.111112.34081@kuhub.cc.ukans.edu>
Source record: 292988

I didn't see Mr. Henry's original query about building a transmitter, but I did see Mr. Sorgatz's initial response. I sent private e-mail to Mr. Henry, providing pointers to information about amateur radio, and assuring him that most amateurs were friendly and willing to help. Subsequent postings from Mr. Henry suggest that while Mr. Sorgatz's flaming may have been a bit too intense for my own taste, it was not altogether misdirected.

Now many are no doubt looking for ways to filter out postings from these and others who have joined the fray, because they are tired of wading through all of the noise to get to the things that make this group useful to so many of us. It's too bad we don't have kill files for our amateur frequencies when ignorant and/or thoughtless people, licensed or not, mess them up.

3427. periphex batteries

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-04 17:11:55 UTC
From: rosty@ucscb.UCSC.EDU
Message-ID: <21713@darkstar.ucsc.edu>
Source record: 292991

I'm having a problem with a battery that hopefully someone can offer some advice on.

Thirteen months ago, I was preparing to purchase an Icom IC-U16 handheld, so I ordered two BP-7 batteries (600mAh) from Periphex. Things fell through with the purchase of the U16, and the batteries sat unused until a few weeks ago when i finally purchased a U16. So basically, the batteries were never charged nor discharged in a little over a year. I'm using the wall charger (I have both the Icom CM-16U and a Uniden 500mA charger), and notice that one of the battery packs won't hold a charge. It charges up to the full voltage, but only lasts about 30mins (maximum...w/o much xmiting) before it dies. The other one works fine. I disassembled the pack, which looks like this:

O O
O O O
O O O
O O O

The top five batteries are showing much less than normal voltages (ie: a few microvolts) wherease the bottom six show full voltage (around 1.2V). I'm wondering (very limited electronics knowledge here..sorry) if maybe something on the PC board in the battery could of died, or if I really lost 5 of the 11 batteries? In any case, I need a few questions answered: Periphex states in there catalogs that batteries should be "matched" for best performance. It would cost me $45 for a complete new battery insert, vs. $22.50 to replace the 5 bad batteries. Obviously spending half as much would be preferable, as long as it's not going to screw anything up.

Periphex waranty's their batteries for one year.... It's been 13 months. :-(

Any help would be most appreciated! Either post to the net or send email!

Also, some information on the best way to solder these together would be appreciated! The tabs look almost spot-welded on.

-Kirk J. Smith
rosty@ucscb.ucsc.edu

DISCLAIMER: I don't use this HT on airplanes, order pizza with it, monitor cellular phones with it, talk on frequencies for which I'm unlicensed or use a transverter to talk on 11meters! :-) :-)

ps: Whomever posted the people to contact for amateur exams, thanks a bunch! Now that I've got several contact names/numbers, I should have my license soon! Codeless tech, here I come!

3428. Re: The Call Sign Mess

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-04 17:17:18 UTC
From: erich@hp-vcd.vcd.hp.com
Message-ID: <23490002@hp-vcd.vcd.hp.com>
Source record: 292985

/ hp-vcd:rec.radio.amateur.misc / taormina@asl.SINet.SLB.COM / 7:33 am Oct 2, 1991 /
Issuance of call signs has been, traditionally, one of the
things that the FCC has done very badly. In most commercial
services, a call sign is just a nuisance. In broadcasting,
it is a logotype or a statement of broadcast format. In Ham
Radio, IT IS YOUR NAME! (W6BIP actually goes by "Bip"). You
become your call sign (like W9 Ragtime Cowboy Joe!).
Vanity is a big part of our hobby, but seldom part of the
FCC budget. Up until the 50's, call sign issuance was
pretty straight forward. They issued W5AA then W5AAA then
K5AAA call signs. 1 x 2 call signs with an "X" prefix
(i.e. W5XJ) were reserved for experimental stations. When
they ran out of W5AAA and K5AAA they reissued calls that had
been inactive for 5 years. Club stations had their own calls.
A club could request the call of a "silent key" former member,
with the family's approval. You could have as many call signs
as you had addresses.
Then it happened! In the late 50's they ran out of W5XXX and
K5XXX call signs. For a while they issued WV/WA call signs
(I was WV2GGB as a novice and WA2GGB as a general).
They didn't think ahead about the WV4's being a novice call
in the Virgin Islands, so that didn't last. Then came
"incentive licensing." Until that time, when you became a
General, you had all amateur privileges. At the same time,
cutbacks and computer constraints did away with multiple call
signs, club calls and repeater calls (Our repeater was WR5AIC
for a short time). For another brief time in the 70's, Extra's
could pick their own 1 x 2 call sign (I gave up WA5LES for K5RC).
Shortly after that, the FCC instituted the current madness.
It started out as a fairly good idea to have call signs reflect
the class of license, but they made the fatal mistake of not making
it mandatory when you upgrade. They also didn't look far enough
ahead to see what would happen when they ran out of particular
blocks of calls. Now we have a system that makes less sense
than it did before. Why can't call signs be reissued? Computer
technology certainly can support it. Why can't a private agency
(such as ARRL) issue call signs? That has plenty of precedence
in business radio. How about a system that issues sequential
call signs to new Hams, after 1 year, you can request a 2 x 3,
an Advanced a 2 x 2, an Extra a 2 x 1 and an Extra, after 10 years,
a 1 x 2? Let's acknowledge our vanities and join the computer age!

Issuance of call signs has been, traditionally, one of the things that the FCC has done very badly. In most commercial services, a call sign is just a nuisance. In broadcasting, it is a logotype or a statement of broadcast format. In Ham Radio, IT IS YOUR NAME! (W6BIP actually goes by "Bip"). You become your call sign (like W9 Ragtime Cowboy Joe!).
Vanity is a big part of our hobby, but seldom part of the FCC budget. Up until the 50's, call sign issuance was pretty straight forward. They issued W5AA then W5AAA then K5AAA call signs. 1 x 2 call signs with an "X" prefix (i.e. W5XJ) were reserved for experimental stations. When they ran out of W5AAA and K5AAA they reissued calls that had been inactive for 5 years. Club stations had their own calls. A club could request the call of a "silent key" former member, with the family's approval. You could have as many call signs as you had addresses.
Then it happened! In the late 50's they ran out of W5XXX and K5XXX call signs. For a while they issued WV/WA call signs (I was WV2GGB as a novice and WA2GGB as a general).
They didn't think ahead about the WV4's being a novice call in the Virgin Islands, so that didn't last. Then came "incentive licensing." Until that time, when you became a General, you had all amateur privileges. At the same time, cutbacks and computer constraints did away with multiple call signs, club calls and repeater calls (Our repeater was WR5AIC for a short time). For another brief time in the 70's, Extra's could pick their own 1 x 2 call sign (I gave up WA5LES for K5RC). Shortly after that, the FCC instituted the current madness.
It started out as a fairly good idea to have call signs reflect the class of license, but they made the fatal mistake of not making it mandatory when you upgrade. They also didn't look far enough ahead to see what would happen when they ran out of particular blocks of calls. Now we have a system that makes less sense than it did before. Why can't call signs be reissued? Computer technology certainly can support it. Why can't a private agency (such as ARRL) issue call signs? That has plenty of precedence in business radio. How about a system that issues sequential call signs to new Hams, after 1 year, you can request a 2 x 3, an Advanced a 2 x 2, an Extra a 2 x 1 and an Extra, after 10 years, a 1 x 2? The callsign in broadcasting as well as amateur radio is the identification of the station, not the person operating the station. I feel that the FCC has made a big mistake by allowing the commercial stations to pick their own callsigns and also by putting any logic on amateur callsigns other than the district that the station was originally licensed for.

The only valid reason I can see for changing a callsign is when the station is permanently moved from one call area to another.

3431. The war ends.

Everyone seems to think that I am keeping this "war" alive.
I only respond to extremely bad posts which refer to myself or
aj008 Aaron Barnes.
If all of YOU people would stop posting what 15 other people
said in a previous message and go on with what the base is
supposed to be used for,amateur radio,these worthless posts
would disappear.Contrary to popular belief,I am not going to
steal every airwave in the country,nor am I going to hack my
way onto the ham band.If it is filled with people who have
nothing better to do than "flame" less knowledgeable
people who would like to get into this hobby,I don't think Ham
is the place for me.
All I did was ask for plans for a lousy transmitter that has
no range.Everyone else brought up licenses and illegal activities
I was supposedly going to commit.All this was going to be was
something to do one rainy day after school or something.I was
NEVER going to do anything at all remotely illegal with it,I
have much better things to do than screw with the Feds and
sitting in jail.
I will post no more regarding this war of sorts everyone has
started on here.The base is to discuss amateur radio,I will only
confer in a manner that is civil and in accordance with the
charter of this SIG.

By the way,I do plan to get a license this month and
everyone on here will be the first to know.

3432. Recent area 4 calls

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-04 17:59:18 UTC
From: zawodny@arbd0.larc.nasa.gov
Message-ID: <1991Oct4.175918.3757@news.larc.nasa.gov>
Source record: 292993

I have recently upgraded from a tech+ to advanced and I am curious as to what calls are being issued in area 4. The latest QST only has the calls as of Aug 1. I am unable to project to a November 1 issue date with any accuracy (I end up with calls that range from KO4JZ through KO4LW).

I have been told that more recent information has been made available to this group in the past. Has anyone recently upgraded to advanced and received their call since August? Alternatively, and of perhaps more general interest to the group, does anyone have a current (ie. OCT 1, 1991) list for all classes and areas?

73,

Joe KD4ASV/AA zawodny@arbd0.larc.nasa.gov

>and night after night this thorn in our sides continues on.

The concept of "community standards," which are quite different from the norm on the 435 repeater, is one of the main points the article was making. It is silly to think that a governing body based in Washington, D.C. can determine what is obscene for a repeater located 3000 miles away in Los Angeles, CA. And why should it? Standards of decency vary within the U.S. as much as the landscape. I would no more wish to be bound by the FCC's idea of what is obscene as I would be bound by the "dry" laws of some of the eastern states' counties. The impact of the 435 repeater is local to the area and, in actuality only impacts those people who tune the repeater in. As such, why should the users of 435 be subjected to someone elses interpretation of obscenity if it in no way affects the people not using the repeater?

True, the article states that most hams are the "genteel" types who don't approve of this mode of operation, but most hams are not using the Mt. Wilson repeater either.

Even the point of jamming which occurs on 435, and which is limited to that system is arguable as to whether it would be legal or not using the "community standards" principle. Every ham is not entitled to use every repeater, just see how many closed repeaters there are listed in the ARRL repeater directory. The pre-requisites for usage of many repeaters is that you be a club member, or just have the proper PL in your radio. Without these, your point will not be heard. On 435, one of the pre-requisites is that you run enough power to make yourself heard through the system. The regulars on the system will be the first to admit this. If you are on 435 and are getting jammed out by someone else, it's usually looked upon as the fault of the weaker station for not 'using the minimum power necessary to facilitate communication,' as stated by our good ol' FCC.

147.435 is NOT a repeater for the meek and the weak. If you don't like the way the machine is used, there are many other calmer repeaters scattered throughout So. Cal. Ham radio can be a fun hobby. When I received my license it didn't come with a guarantee that I wouldn't be offended by any other hams. If I don't like the way a group is playing

on their repeater, I'm free to tune somewhere else.

You've make some excellent points here. One way of saying this the
characteristic impedance of the line governs the ratio of voltage to
current for TEM (transverse electromagnetic) transmission line mode.
The impedance seen by the source at low frequency is governed by the

load at the other end; if it is a short, you see an inductance, but if it is open, you see a capacitance. The only time the source sees a constant impedance vs. frequency is if the line is terminated in a resistance equal to its characteristic impedance. For reference, there is a nice discussion of transmission lines in the low-frequency (quasistatic) regime in an undergraduate text on electromagnetic theory by Melcher and Haus of MIT.

Even free space has a characteristic impedance (377 ohms), but it's tough to measure :-)

>for a reason that is unclear to me.

It's unclear to me too. Broadcasting BCB FM for a couple of blocks is
in fact perfectly legal, provided that you follow the recently-liberalized
FCC regulations. I have a Ramsey FM stereo transmitter that has a
range of about 1/2 mile, and it is legal. Ramsey's kits are easy to
build, and they (usually) work.

Don't let the guy that flamed you get you down. There are people like
that on the net, and the rest of us just live with it. Such people
are NOT representative of ham radio in general. We're usually pretty
friendly folks, actually.

I hold a different view. I say- get a kit, like Ramsey's FM stereo transmitter kit, build it, get on the air, and have fun. This is a way to learn about how transmitters work. If you are interested in going further, study for a ham radio license, because ham radio is a great way to learn about radio and to have fun. Hams should encourage people like this- he's interested in radio. Who knows, he may make a great ham someday. Some of the great radio pioneers started with fooling around with spark transmitters. If Edwin Armstrong had posted a message today, he would probably be flamed off of the map too.

Yes, someone was posting such information but I don't recall seeing it
this month yet. In any case, you can telephone the FCC in Gettysburg
at 717-337-1212 with a touch-tone phone and get the information you
seek on a recording. It seems to be available at any time of day or
night.

From: paulz@hpspdla.spd.HP.COM
Message-ID: <32920034@hpspdla.spd.HP.COM>
Source record: 292830

My opinion based on a lot of experience is to go for it. Hook it up and see if it works. Assuming that the antenna presents a genuine 50 ohm resistive load, the SWR on the line will be 75/50 or 1.5 to 1. That will not cause any significant extra loss in the coax. Depending on the length of the cable, the impedance seen at the input will be:
50 ohms resistive if the cable is a multiple of half wavelength
100 ohms resistive if the cable is an 1/4, 3/4, 5/4 ... wavelength
Something in between with some reactance at other lengths.

While the theoretical purists will surely have other points of view, for hobby purposes, this feedline should be just fine.

Let us know what you do and how it works out.

1. I accept you apology for the query about a business radio in a notes group on Amateur Radio. Afterall, one of the justifications for Amateur Radio is to experiment and learn things that might benefit everyone.

2. Now to the real question. There is relatively little difference in the propagation for VHF or UHF signals. Both are generally limited to line of sight. In a big city, UHF can possibly penetrate into steel framed buildings slightly better. The real question is the availabity of channels for your intended use, and the number of other people who might share them. Also different brands of equipment might have some specific advantage like the VHF line is 10 years old, but they have a completely new UHF radio they are promoting.

Please post what you finally decided, and if it worked out for you.

* MIR NEWS *
============
KP4BJD reports that Cosmonauts Sergey, U5MIR, and Anatoly, U7MIR, pass
along their kindest regards and warm-hearted greetings as a measure
of their appreciation to all the Amateurs who have contributed
news and information to their personal message system (U5MIR-1).

The Mir exchange crew was launched on 02-Oct-91 and docked with
the spacestation on 04-Oct-91. Sergey's old commander, Alexander
Volkov, U4MIR will be replacing Anatoly Arcebarsky, U7MIR, who
is expected to return to Earth on 09-Oct-91.

Dave, N6JLH, spoke with U5MIR on 30-Sep-91 on a frequency of 145.975 MHz.
The personal message system, as well as the AREMIR Austrian Amateur Radio
Experiment, will be operating on this frequency as well. The experiment
will be transmitting a one-line packet beacon and CW messages.

N6JLH also reported that the solar panels for the Kristall module will
be replaced in January.

* SATELLITE OF THE WEEK *
==========
The "Satellite Of The Week" feature is in response to numerous requests
for amateur satellite transponder passband and beacon frequency information.
All active amateur satellites will be covered in upcoming weeks.

Name : SARA-OSCAR-23 Catalog Number: 21578, Launched on 17-Jul-91
Orbit : Low-altitude, circular

Another satellite of interest that went aloft with ARIANE V-44 was 'SARA',
a French Amateur Radio Astronomy satellite monitoring eight 100 KHz wide
channels between 2 and 15 MHz for radio emissions from Jupiter.

SARA's 1-watt NBFM output is 300-baud ASCII coded into 1200 Hz and 2400 Hz
AFSK audio tones and sent down at 145.995 MHz. Its RTTY-like signal was
first heard in Japan by JR3FRF.

The experiment was detailed by ON1KHP, as a follow up to VOYAGER-1, which
was unable to measure anything but a few of the strongest Jovian peaks
because of both the short stay duration and self generated EMC QRM.
'SARA' is a very simple satellite with three perpendicular five meter
antennas that produce a combined quasi-isotropic pattern, hence no need for
stabilization. Its 340 mm cube is powered by 60% coverage of solar cells
feeding the battery, with no need for power or voltage regulation. The
other 40% of the surface is painted so as to passively regulate the
temperature to around +20 degrees C. It uses non-space qualified normal
consumer available components, with no redundancy planned.

Despite it's low budget cost, SARA will undoubtedly perform this valuable
scientific research program which cannot be done on Earth, as the radio
signals from Jupiter can only penetrate Earth's F, E and D layers at the
highest frequency end of the spectrum. In space, Solar and Earth radiation
is relatively small compared to the giant planet, and so, according to
microprocessor controlled antenna and sequence selection, good results are
expected.

3445. Recent RTTY and other loggings

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-05 15:16:32 UTC
From: crisp@netcom.COM
Message-ID: <1991Oct05.151632.16023crisp@netcom.COM>
Source record: 293021
Cross-posted to: rec.radio.shortwave,rec.radio.amateur,rec.radio.amateur.misc

Here are a few RTTY loggings from the last couple of days. These
were logged using an NRD 525 receiver and a Universal M7000
decoder.

3446. How do I get RTTY on a PC???

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-05 15:23:54 UTC
From: mtynan@vax1.tcd.ie
Message-ID: <1991Oct5.152354.1@vax1.tcd.ie>
Source record: 293016

Can anyone out there tell me how to go about receiving RTTY on a PC?

At the moment I have a Fairmate HP2000e with no audio-out, only an EAR socket.

Thanks!

Mark.

3447. Re: Information on voltage regulator

How about using one of the circuits found in the LM317 (etc.) data sheets which straps an external power transistor around the 3 pin device? Maybe you also ought to look at the LM723 chip, which can be configured into almost any kind of linear regulator you want with external transistors?

3448. More CW in music

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-05 15:48:27 UTC
From: dana@locus.com
Message-ID: <1991Oct05.154827.808596@locus.com>
Source record: 293022

The B-52s self-titled first album contains the tune "Planet Claire",
which starts out with some commercial CW:

"NAWS DE CFH II ZKR F133 ..." the music now overpowers the CW.

There's also some RTTY audible in the background.

3449. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-05 16:10:51 UTC
From: tkelso@galaxy.afit.af.mil
Message-ID: <tkelso.686679051@galaxy.afit.af.mil>
Source record: 293020

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space and rec.radio.amateur.misc. This week's elements are provided below.

3450. TH77 (Japan version) mods

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-05 16:15:07 UTC
From: pvh@Apple.COM
Message-ID: <58220@apple.Apple.COM>
Source record: 293019

I have a Japanese version of the TH-77 and IUd like to make the out of band mods to it (118-136 aircraft RX, 136-174 TX/RX, 400-512 MHz TX/RX, 800-900 MHz RX etc.). The thing is when I opened up the unit and looked in, the ICs that are supposed to be removed for the 77A for the mods appear to be ALREADY MISSING. I asked Kenwood USA about the differences between the 77 & 77A and they said they couldnUt tell me because they were licensed by the FCC or something and that IUd have to go to Tokyo Kenwood to find out, theyUd be more than happy to tell me. Aargh!

So has anyone out there made modifications to the TH-77, Japan version, to make it US compatible and to make it work out of amateur band?

Thanks,

Pete

3451. RE: Who owns spectrum?

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-05 16:49:30 UTC
From: dwilson@s850.mwc.EDU
Message-ID: <9110051646.AA10163@ucsd.edu>
Source record: 293027

Concerning who actually "owns" the radio spectrum:
"The administration is proposing that both public and private radio licensees be given property rights to their portion of the spectrum, including the right to buy and sell" (pg. 41 of October, 1991 Signal--the monthly publication of the Armed Forces Communications and Electronics Association).

I do not know whether to remark what a bad idea that is (we all know what deregulation of cable TV has cost us) or whether to just say "money talks."

MEMFEST 91
Greater Memphis Hamfest & Computer Show
OCTOBER 12-13, 1991

You are cordially invited to attend MemFest 91 sponsored by all Memphis are Hams. Plan to bring the whole family and spend a few days in Memphis, Tennessee, the city that is famous for Elvis, the Mississippi River, the Peabody Hotel, Beale Street, the Great American Pyramid and many more.

Location: Pipkin Building, Mid-South Fairgrounds

Hours of Operation: Saturday, 9:00 a.m. - 4:00 p.m.
Sunday 9:00 a.m. - 2:00 p.m.

Talk-in and Info: 146.28/.88 & 444.0/449.0

Admission: $5.00 per person (includes 6 attendance prize tickets)
(Prize's rumored to consist of Kenwood gear TS-850 etc.)

WCARS VE Exams: Saturday, October 12, 9:00 a.m. (walk-in)

ARRL Forum: Saturday, October 12, 1:00 p.m.

MARS Forum: Saturday, October 12, 2:30 p.m.

Emergency Phone Number: (901) 486-0003
Leave this number with the folks back home, in case they should need you, and we will try out best to get a message to you.

General/Exhibitor Info : Nita Wofford, N4DON (901) 363-4971

Flea Market : All tables sold out as of this date. for info contact Steve Cheeseman NX3W (901) 365-6621

If you need any other info please send me a e-mail message and I will try to get back with you.

Source record: 293024

As quoted from <30066@ttidca.TTI.COM> by sorgatz@avatar.tti.com (Erik Sorgatz):
+---------------
| Ok, it seems that none of you share my opinion that college kids should be
| able to read and research such a trivial thing as building a Part 15 device
| for the AM broadcast band. No problem, this kind of response just verifies
+---------------

I do. But:

* look up the percentage of college students who need to take remedial English
classes;

* study the reasons *why*; and

* quit being surprised at basic ignorance.

+---------------
| 1) It's perfectly alright for someone at college level to use this group
| as a resource for information that could be gathered by even a cursory glance
| at any number of electronic hobby-oriented publications or books. Right.
+---------------

The same problem exists in comp.unix.*, and just about every other technical
newsgroup. And has been present since at least 1984.

+---------------
| 2) It's not cool to flame someone for being:
+---------------

It's not cool to flame someone, PERIOD. Behave like the adult you putatively
are instead.

3455. FT411 PTT lock feature keystroke mod

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-05 17:42:32 UTC
From: wa2ise@cbnewsb.cb.att.com
Message-ID: <1991Oct5.174232.11397@cbfsb.att.com>
Source record: 293023

copied from packet:
Sb: PTT MOD FOR FT-411

HELLO, A FEW DAYS AGO I WAS USING MY FRIEND'S YASEU FT-411 AND FOUND OUT THIS NEAT TRICK!!! FIRST, A LITTLE BACKGROUND... AS I'M SURE SOME OF YOU KNOW, YASEU CAME OUT WITH THE POPULAR 411 A FEW YEARS AGO. JUST RECENTLY, THEY CAME OUT WITH AN "ENHANCED" MODEL, THE 411-E. THE ONLY FOUND DIFFERENCE IS THE FREQUENCY LOCK OF THE RADIO. THE 411E HAS A FEATURE THAT LETS YOU LOCK THE PTT AS WELL AS THE FREQUENCY.

TO ACTIVATE PTT LOCK ON THE 411:
--TURN RADIO OFF
--PUSH THE 6 BUTTON, HOLD IT AND TURN ON THE RIG WHILE YOUR STILL HOLDING IT.
--NOW, PRESS FM 6, YOU SHOULD SEE "L".
--PRESS FM 6 AGAIN, YOU SHOULD SEE "PTT"(BOTH L AND PTT WILL APPEAR IN THE BOTTEM LEFT CORNER OF THE LCD DISPLAY.

CONGRADULATIONS YOU HAVE INSTALLED PTT LOCK IN UR RIG. TO TURN IT OFF, JUST REPEAT THOSE STEPS.

MIKE-N2LPD @ N2IMC.NJ.USA.NA

Note: I haven't tried or verified this, proceed at your own risk. WA2ISE

3456. Understanding the Daily Solar Geophysical Data Broadcasts

!!END-DATA!!

LINE 01
-------
!!BEGIN!! (1.0) S.T.D. Solar Geophysical Data Broadcast for DAY 248, 09/05/91

!!BEGIN!! : Signifies the start of the report, for computer-controlled
extraction of the data.

(1.0) : Represents the version number of the broadcast, to be used
with the same software version, if software is used.

DAY 248 : The day of the year for the report.

09/05/91 : Equivalent Month/Day/Year of the report.

LINE 02
-------
10.7 FLUX=164.5 90-AVG=206 SSN=204 BKI=5454 3323 BAI=025
```

10.7 FLUX=164.5 : The 10.7 cm solar radio flux as reported by the
NRC-Dominion Radio Astrophysical Observatory (DRAO) in
Penticton, British Columbia, Canada (formerly produced
by the Algonquin Radio Observatory in Ottawa).

90-AVG=206 : This value represents the 90-day average 10.7 cm solar
radio flux.

SSN=204 : This value is the observed sunspot number as observed by
NOAA.

BKI=5454 3323 : These digits represent the 8 three-hourly Boulder K-indices
as observed by the Boulder USGS magnetometer. The first
digit represents the observed K-index for the period from
00:00 UT to 02:59 UT. The second digit represents the
observed K-index from 03:00 to 05:59 UT, and so forth.
If data is unavailable, it is replaced with an asterisk.

BAI=025 : This value is the observed 24:00 UT Boulder A-Index for
Boulder, Colorado.

LINE 03

BGND-XRAY=B8.6 FLU1=2.7E+05 FLU10=8.3E+03 PKI=5454 4333 PAI=029

BGND-XRAY=B8.6 : This is the background x-ray flux value as reported by the
Space Environment Laboratories. This value is produced by
observing the background x-ray emissions in the soft-xray
band (1 to 8 Angstroms). Consult the "Glossary of Solar
Terrestrial Terms" as produced by the STD for information
on understanding the x-ray classification scheme. This
document is available for anonymous FTP from the site:
"solar.stanford.edu" in "/pub", or on "nic.funet.fi".

FLU1=2.7E+05 : This value is the observed proton fluence at greater than
1 MeV (million electron volts).

FLU10=8.3E+03 : This is the observed proton fluence at greater than 10 MeV.

PKI=5454 4333 : These digits represent the 8 three-hourly estimated
planetary K-index values for the UT day. The format is
the same as is used for the Boulder K-indices noted above.

PAI=029 : This value represents the estimated planetary A-index value
for the UT day. Occassionally, this value is not available
at the time the data set is compiled. If this is the case,
a preliminary calculation is made to estimate the planetary
A-index value using the planetary K-indices. Although this
will not produce an officially accurate result, the results
calculated in this way are usually accurate to +/- 2 points.

LINE 04

BOU-DEV=093,051,073,060,023,030,012,021 DEV-AVG=045 NT SWF=05:079

BOU-DEV=093,051,073,060,023,030,012,021
These values represent the observed maximum deviation in
the Boulder USGS magnetometer. The values are in nano-
tesla (nT, or reported as "NT" elsewhere in the report).
The first value represents the observed maximum deviation
of the geomagnetic field (using the most disturbed magnetic
component) during the period 00:00 UT to 02:59 UT. In this
example, the maximum deviation observed was 93 nT between
00:00 UT and 02:59 UT. The second value represents the
maximum deviation between 03:00 UT and 05:59 UT. Each of
these values correspond to the observed Boulder K-index
as reported on line 2 of this daily report.

DEV-AVG=045 NT : This value represents the average daily maximum deviation
of the Boulder magnetometer, given in units of nanotesla
(or NT). It is produced by simply averaging the 8
three-hourly maximum deviation values given on this line.

SWF=05:79 : The first value (05) represents the number of possible
episodes of Short Wave Fades (SWFs) observed during the
UT day. Short wave fading is simply a period of time when
the absorption of High Frequency (HF) radio waves increases
which produces a decrease in signal strengths of HF signals
OVER SUNLIT AREAS. In other words, this value represents
the approximate maximum number of times HF signals may have
faded out during the UT day. It is important to note that
SWFs are the strongest over the low and middle latitudes
and are ONLY observed during the daylight hours, preferably
when the sun is higher in the sky.

The second value (79) represents the estimated maximum
number of minutes that solar-flare activity may have
produced observed SWFs. In this example, solar activity
may have produced observed SWFs as many as five times
during the UT day. The estimated maximum number of
minutes that signals may have been degraded was 79.

Please note that these values are estimated maximums.
It is important to remember that most regions of the world
are in darkness for many hours each UT day. During periods
of darkness, SWFs will not be observed. Therefore, these
values are most useful as indicators of the possible
ionospheric disturbances which may have occurred during
the daytime hours. Days with 00 episodes of SWF activity
denote low levels of daytime sporadic HF signal absorption.

LINE 05

XRAY-MAX= M4.4 @ 0111UT XRAY-MIN= B8.0 @ 0914UT XRAY-AVG= C2.5

XRAY-MAX= M4.4 @ 0111UT
This value represents the maximum observed X-ray level

during the UT day, as well as the time of its occurrence.
In this example, x-rays during this UT day peaked at a
class M4.4 level at 01:11 UT.

XRAY-MIN= B8.0 @0914UT
This section of the report represents the minimum observed
x-ray level during the UT day. Same format as the maximum.

XRAY-AVG= C2.5 : This value represents the average x-ray flux observed
during the UT day. This value is determined by averaging
all of the 1-minute x-ray values during the UT day. This
average value might not always be determined by a full set
of one-minute daily values. If data from the GOES
spacecraft supplying this information is temporarily
halted, this value will be calculated from those daily
one-minute values which are received. It is therefore
possible, (although extremely unlikely) that this average
value may be produced from only one or two one-minute flux
measurements.

It is important to distinguish the difference between the
background x-ray flux and the average x-ray flux. The
average x-ray flux is the actual numerical average of all
daily x-ray bursts (including all x-ray flares). The
background x-ray flux is the lowest stable x-ray level
observed during the day which is not associated with x-ray
bursts. The x-ray average will therefore almost always be
higher than the background x-ray flux. In this example,
the average x-ray flux is a fair bit higher than the
background level, possibly due to a number of x-ray bursts
which occurred during the UT day.

LINE 06

NEUTN-MAX= +003% @ 2250UT NEUTN-MIN= -002% @ 1700UT NEUTN-AVG= +0.5%

NEUTN-MAX= +003% @ 2250UT
This is the maximum observed neutron monitor count as
observed by the Thule neutron monitor. It indicates a
maximum observed value of 3% which occurred at 22:50 UT.
Significant maximums of greater than 10% may be related to
Ground Level Events (GLEs) which are associated with near-
relativistic particle bombardments from major solar flares.
These neutron monitor values are determined by examining
the 5-minute averages of the neutron monitor count rates.

NEUTN-MIN= -002% @ 1700 UT
This is the observed minimum neutron monitor count as
measured by the Thule neutron monitor. Values below
-5% may be related to Forbush decreases (FDs) which are
most often associated with strong geomagnetic disturbances.

NEUTN-AVG= +0.5%: This value represents the average neutron monitor count as observed by the Thule neutron monitor. Average values below -5.0% are associated with Forbush decreases.

LINE 07

PCA-MAX= +0.7DB @ 1425UT PCA-MIN= -0.2DB @ 2325UT PCA-AVG= -0.1DB

PCA-MAX= +0.7DB @ 1425UT
This section shows the maximum Polar Cap Absorption (PCA) level observed during the UT day by the Thule T30A Riometer. Positive values indicate elevated levels of ionospheric absorption over the polar regions. As a result, positive values (particularly in excess of about 1.0 to 2.0 dB) are sufficient to cause notable attenuation of HF signals over or near the polar regions. Values larger than 3.0 to 4.0 dB may cause heavy to complete absorption of HF radio signals over the polar and possibly some high latitude signal paths. Riometer values less than or equal to 0.0 dB are associated with negligable absorption levels over the polar regions. Note that small levels of absorption (of only a few tenths of a dB) may be sufficient to cause errors in navigational signals such as OMEGA navigational signals traversing the polar regions.

PCA-MIN= -0.2DB @ 2325UT
This is the minimum PCA level observed during the UT day.

PCA-AVG= -0.1DB : This is the average PCA level observed during the UT day and is calculated by averaging the 5-minute averaged riometer measurements during the UT day.

LINE 08

BOUTF-MAX=55331NT @ 2250UT BOUTF-MIN=55263NT @ 1649UT BOUTF-AVG=55301NT

BOUTF-MAX=55331NT @ 2250UT
This is the maximum observed value of the Total magnetic Field (TF). The total field value is calculated by using all three orthogonal components of the geomagnetic field. These values are valid for Boulder, Colorado. The field values are in units of nanotesla (NT). The time of the maximum is also indicated.

BOUTF-MIN=55263NT @ 1649UT
This is the minimum observed value of the total field at Boulder, Colorado.

BOUTF-AVG=55301NT
This is the daily average of the total magnetic field strength as observed at Boulder for the UT day.

LINES 09 & 10

GOES7-MAX=E:+113NT@ 0607UT GOES7-MIN=N:-052NT@ 0911UT G7-AVG=+067,+063,+002
GOES6-MAX=P:+101NT@ 1925UT GOES6-MIN=N:-010NT@ 1439UT G6-AVG=+073,+026,+014

These two lines report the maximum, minimum and observed
average values of the geomagnetic field at geosynchronous
altitudes as observed by the GOES-6 and GOES-7 spacecraft.
GOES-7 is the primary spacecraft and is therefore reported
first.

The first capital letter following the "GOES7-MAX="
statement indicates which component of the magnetic field
experienced the maximum value observed during the UT day.
There are three possible letters which may be used here,
representing one of the three possible magnetic components:
P = The component parallel to the Earths rotation
axis. Positive values are northward. Negative
values are southward.
E = This is the Earthward component. Positive
values represent a downwardly directed field
(ex. toward the Earth or Earthward).
N = This component is perpendicular to the other
two. Positive values represent a westwardly
directed field. Negative values are eastward.
The figure following the "P:", "E:", or "N:" is the
observed magnitude of that component, followed by the time
that the value was observed. In this example, the GOES-7
spacecraft Earthward magnetic component was the observed
maximum component during the UT day. The magnitude of this
maximum Earthward component was +113 nanoteslas. This
represents a downwardly directed magnetic field with a
strength of 113 nT. GOES-7 observed this max at 06:07 UT.

This same format is followed for the minimum values
observed on GOES-7 as well as for the values on GOES-6.

G7-AVG=+067,+063,+002
This line reports the average geomagnetic field strengths
for the three magnetic components of the GOES-7 spacecraft.
The first value will ALWAYS represent the Parallel magnetic
component. The second value will ALWAYS represent the
Earthward magnetic component. And the last value will
ALWAYS represent the Perpendicular component. So in this
example, the average daily magnetic field strength for the
parallel component was +67 nT. The Earthward component had
an average field strength value of +63 nT while the
perpendicular component had an average value of +2 nT.

This same format is followed for the average values of the
GOES-6 secondary spacecraft.

LINE 11

FLUXFCST=STD:160,157,155 ; SESC:160,155,150 BAI/PAI-FCST=15,10,10 / 15,15,18

FLUXFCST=STD:160,157,155 ; SESC:160,155,150
The first three values represent the 72-hour forecast
10.7 cm solar radio flux values as produced by the Solar
Terrestrial Dispatch (STD). The second group of three
values are the 72-hour 10.7 cm solar radio flux forecast
values as issued by the Space Environment Services Center.
If either of these two forecasts are unavailable, "N/A"
will be used in place of the digits.

BAI/PAI-FCST=15,10,10 / 15,15,18
The first group of three values represent the 72-hour
forecast Boulder A-Index (BAI) values as issued by the
Space Environment Services Center. The second group of
three digits represent the 72-hour forecast Planetary
A-Index values (PAI) as issued by the United States Air
Force (USAF) Global Weather Central.

LINE 12

KFCST=3344 5433 2334 4211 27DAY-AP=019,011 27DAY-KP=2333 4333 2233 2322

KFCST=3344 5433 2334 4211
These digits represent the 48-hour K-index fourcasts as
released by the Space Environment Services Center. The
first value represents the forecast K-index value for 00:00
to 02:59 UT. The second value represents the forecast K-
index value from 03:00 UT to 05:59 UT, etc. The sixteen
digits define the expected K-indices for the next 48 hours.

27DAY-AP=019,011: These values are the historical estimated planetary A-index
values that were observed 27 days ago (approximately one
solar rotation). The first value represents the observed
estimated planetary A-index value 27 days ago. The second
value represents the value observed 26 days ago. These
two values may help serve as a guide to the possible
intensity of recurrent geomagnetic phenomena.

27DAY-KP=2333 4333 2233 2322
These digits are the estimated planetary K-index values
that were observed 27 days ago. The first group of eight
digits (2333 4333) represent the three-hourly planetary
K-indices that were observed 27 days ago. The second
group of eight digits (2233 2322) represent the K-index
values that were observed 26 days ago.

LINE 13, 14...

WARNINGS=*MAJFLR;*PROTON
ALERTS=**MAJFLR:X1.1/2B,N20E29(6857),0523-0555-0641,II=2@0551,IV=3@0602;
MINFLR:M4.4@0111;MINFLR:M2.3@0528;**MINFLR:M1.6@1209;
**TENFLR:2200,DUR:N/A

These lines summarize the Warnings and Alerts which are active at
the end of the UT day. Each warning category is prepended with a SINGLE
asterisk. Each alert category is prepended with DOUBLE asterisks. The end
of each warning and alert is appended with a semicolon if more warnings
follow. If no warnings follow, a carriage return concludes the category.
Warnings and alerts may span several lines. These WARNINGS are valid:

*MAJFLR = Potential Major Flare Warning
*PROTON = Potential Satellite Proton Event Warning
*PROTFLR = Potential Proton Flare Warning
*GSTRM = Potential Geomagnetic Storm Warning
*MSTRM = Potential Minor Geomagnetic Storm
*JSTRM = Potential Major-Severe Geomagnetic Storm
*AURMIDWCH= Middle Latitude Auroral Activity WATCH
*AURMIDWRN= Middle Latitude Auroral Activity WARNING
*AURLOWWCH= Low Latitude Auroral Activity WATCH
*AURLOWWRN= Low Latitude Auroral Activity WARNING
*PCA = Potential Polar Cap Absorption Event Warning

The following ALERTS are valid:

**MAJFLR = Major Solar Flare Alert
**MINFLR = Minor Solar Flare Alert
**MINSTRM = Minor Geomagnetic Storm Alert
**MAJSTRM = Major Geomagnetic Storm Alert
**SVRSTRM = Severe Geomagnetic Storm Alert
**PCA = Polar Cap Absorption Event Alert
**PCAENH = Polar Cap Absorption Enhancement Alert
**PROTN10 = Satellite Proton Event Alert at > 10 MeV
**PROTN100= Satellite Proton Event Alert at > 100 MeV
**PROTNENH= Satellite Proton Enhancment Alert at > 10 MeV
**MAGSI = Magnetic Sudden Impulse Alert
**245STRM = 245 MHz Radio Noise Storm Alert
**TENFLR = Tenflare Alert
**SWEEP = Sweep Frequency Event Alert
**FORBUSH = Forbush Decrease Event Alert

Each of the alerts may be followed by a colon and very terse descriptive
text describing parameters of the event. For example, the alert section
within this example reads:

ALERTS=**MAJFLR:X1.1/2B,N20E29(6857),0523-0555-0641,II=2@0551,IV=3@0602;
MINFLR:M4.4@0111;MINFLR:M2.3@0528;**MINFLR:M1.6@1209;
**TENFLR:2200,DUR:N/A

This line consists of FIVE alerts (each set of double asterisks denotes the
start of a new alert): One major flare alert, three Minor Solar Flare alerts
and a Tenflare alert. In this example, the major flare was a class X1.1/2B

event located at N20E29 within Region 6857. It began at 05:23 UT, peaked at 05:55 UT and ended at 06:41 UT and was associated with a Type II sweep (importance 2) at 05:51 UT and a Type IV sweep (importance 3) at 06:02 UT. If a tenflare would have been associated with this event, it would have been treated as a separate alert with a time corresponding to the time of the major flare. In this ficticious example, no tenflare was observed.

The first minor solar flare was a class M4.4 which occurred at 01:11 UT. The second was a class M2.3 at 05:28 UT. The third was a class M1.6 at 12:09 UT and the Tenflare was observed at 22:00 UT. The DURation of the tenflare was unknown (not available) at the time the report was compiled.

Notice that the last alert is not followed by a semicolon. This marks the end of the alert section.

LAST LINE

!!END-DATA!! : The last line of the daily report will ALWAYS contain this final statement, which signifies the end of the data set.

FINAL NOTES

Additional warnings and alerts may be added to those mentioned here. The format of this data set may also change over time. Data may be added or deleted from the existing data set. However, for the most part, the structure will remain the same. Comments may be appended to the message following the dataset (ex. following the !!END-DATA!! marker), although this will not be a common practice. The length of the daily data set should be approximately 15-16 lines, but may vary slightly depending on the number of warnings and alerts that are active during each day.

This is the same data set that is sent to other organizations and institutions for research or professional purposes. Individuals or organizations with a need to directly receive this data through email should send requests for placement on the mailing list to: Oler@Hg.Uleth.CA, or to: COler@Solar.Stanford.Edu. Only those with a professional need, or those who receive the data too late to be of value, are encouraged to request direct access to the mailing list.

There may be infrequent days when no data sets are broadcast. This may be due to local computer problems, or perhaps possible problems with sites forwarding the data sets through the nets. In most circumstances, the data sets should arrive daily. They are usually released once a day, sometime after approximately 02:00 to 03:00 UT. This time lag into the new UT day is required so that all of the data associated with the previous UT day may be collected and processed for inclusion with the daily data set.

Of course it can be done. In fact, Ray you can tie all three antennas together at the centre and feed 'em with just one coaxial cable.

However, you really shouldn't be posting antenna questions in rec.radio.swap. rec.radio.amateur.misc is a much better place to post antenna questions, and you won't get flamed by people who only want to read buy/sell stuff in radio.swap...

| the air). I will become (assuming I pass the Technican exam next
| week!) a new ham, and was wondering how one could contact the FCC in
| situations like this.
+---------------
```

The FCC won't become involved without documented evidence including the time(s) when the "pirates" can be heard (and therefore traced): their workload is too high. Instead, contact the local Official Observer group; you can find out who from the ARRL. The OOs will gather the necessary information and submit it to the FCC in a form they will accept.

Message-ID: <21797@darkstar.ucsc.edu>
Source record: 292832

I just got my novice license and I think that I may have found a good beginner's radio to start with. It is an already assembled Heathkit DX-20. It is used and if I buy it I will not know if it is working until I get it. I'm getting it thru the net. What I want to know is is this a good beginning transciever? Is is easy to use? Can someone give me the specifics on it say from an old Heathkit catalog? How can I get a Heathkit catalog? (I can't find my old catalog and don't remember their phone number) Does anyone have a manual / assembly instructions that I can use if something goes wrong?

The guy I may buy it from said that he never used it because he upgraded to a better radio but when he powered it up the tubes lit up. He couldn't test it for me because he didn't have an antenna that he could use in his apartment yet.

Please e-mail me, there's too much traffic for me to completely keep up with here.
Thanks,
Joshua Goldsmith

Richard is right, and so is Roger, but they are answering different questions. A transmission line that is not an appreciable fraction of a wavelength long will act primarily as a simple coaxial feedthru capacitor with a value of about 30pf/ft. Such "capacitors" are often used as gamma match capacitors in HF antennas and short coaxial capacitors are widely used at UHF.

Roger is also right in a way because he is placing this capacitor in the middle of a long transmission line that has another value of impedance. There the discontinuity of impedance will cause a reflection *on the long line*. If the long line were not present, there would be no reflection because the short section is not long enough to behave as a transmission line at the frequency of operation.

>
>I thought the supreme court said it
>was perfectly legal to listen in on
>cordless phone conversations.

Cordless phones yes, cellular phones no. There is a law called the ECPA (Electronic Communications Privacy Act) that the cellular industry rammed down Congress' throat that forbids listening to cellular phone conversations. Now Section 8 of the FCC authorization bill will make it illegal to have a radio that is capable of covering the cellular (and adjacent other service's) frequency range (800-900 Mhz) at all.

The ECPA has an exemption that allows incidental reception of cellular calls while tracking an interference problem. This allows use of service monitors on these frequencies. The new law outlaws any scanning receiver including spectrum analysers and the cellular telephones themselves from being made or sold. That's not it's *intent*, but is what it's wording *says*. Also trunking radio services, which inherently employ scanning receivers, share part of the forbidden spectrum. So your police department's new radio system will be illegal too. This is very bad law and must be changed.

>This may be a stupid question and I'm
>not challenging the FCC or anything,but
>is there someone sitting around 24 hours
>a day listening to every frequency to
>see if someone is pirating on it?
>How do they tell anyway,just by someone
>saying their call sign before anything
>else?What is to stop someone from making
>a false call sign?

The FCC operates several monitoring stations around the country that are manned 24 hours a day. Mainly they are there to respond to complaints of legitimate users of the spectrum that they are being interfered with by pirate operation. I've had the pleasure of visiting one of these monitoring stations and have ridden in one of their mobile monitoring vans. They are able to get a directional fix on a signal in less than a second of steady carrier. Besides responding to complaints, they also do routine monitoring sweeps of the spectrum to insure licensed users are complying with the law and that intruders are identified and eliminated. The one area of the spectrum that they routinely ignore unless they receive frequent complaints of interference to TVs or other services is the 27 Mhz CB region. The illegal

operation there is so rampant that they don't have the manpower to make cases. Nearly every CBer is in violation of some rule every time they transmit. Since they mostly only annoy other CBers who are also operating illegally, the FCC pretty much tries to pretend they don't exist. But the FCC is very much aware that they *do* exist and is determined to not let another part of the spectrum get so out of hand.

>Also,I was told of a license where you
>do not have to know morse code to get
>it.What exactly do you have to know
>and how uch does it cost to get this license?

The amateur Technician license was recently changed to eliminate the Morse Code requirement. A holder of this license has full amateur priviledges, except space operation, on all amateur bands above 30 Mhz. An Extra class license is required for space operations, but the FCC has routinely waived this requirement because none of the astronauts has an Extra class license. This is a rule that clearly makes no sense and should be changed. In any event, to get the Technician license, you must pass a 55 question multiple choice test on radio theory, rules, and operating practices. The test is administered by volunteer examiners and they are allowed to recoup their out of pocket expenses by charging a small fee. Currently it's about $5. The license itself is free. All of the questions that may be on the test are publicly available for your study. Radio Shack, the ARRL, and others publish books to aid you in passing the exam. The exams are given in most areas by local amateur radio clubs on a monthly basis. In many areas several clubs give the exams and you should be able to find a testing session any week of the year.

>to transmit in violation of the FCC regulations is against the law.

The government doesn't *own* the airwaves, it holds them in trust for
the people of the United States subject to international treaty agreements.
It says so right in the preamble to the Communications Act of 1934, the
enabling legislation that founded the FCC. As such, the *people* own
the airwaves and *authorize* the government to *manage* the airwaves
"in the public interest". This indicates to me that "spectrum fees"
in excess of management expenses are illegal since they are a form of
rent charged members of the public on something the public already owns.

Not withstanding the above rant, the public, through their elected
representatives, have given the FCC power to manage the public airwaves
and use contrary to that management is illegal.

>430Mhz range? Or, any rig that can be modified easily to do so. The
>rig should be relatively small in size, and bells/whistles are not
>needed.

The Yeasu FT470 will operate down to 430 Mhz in it's unmodified state.
After a simple modification, it will cover the entire 70cm band down
to 420 Mhz.

Everyone should complain to the manufacturers about them not offering
a factory stock radio that covers the *entire* 70 cm band. This is
the only amateur band that manufacturers routinely leave 2/3 uncovered
by their equipment. This poses a serious threat to our continued access
to the entire 70 cm band.

]
]I do not know whether to remark what a bad idea that is
](we all know what deregulation of cable TV has cost us)
]or whether to just say "money talks."

I can see that this would be threatening to ham radio. On the other hand, I would expect it to greatly increase spectrum efficiency. Anyone with a spectrum analyzer can see how lousy US spectrum efficiency is. A system where frequencies could be bought and sold might encourage people with underused frequencies to sell them to someone with more use. Of course, it might also encourage people to hoard frequencies as a capital investment.

Certainly a complex situation.

Yeah, and people in-between too, like a full-time corporate slave and
part-time grad student like myself. I also write the Monthly Elmers List
by the way.

And now that you mention it, I've seen just as many brainless newbie questions
coming from *.com sites, including a post from some newcomer asking all the
classic FAQ's. In a later E-mail chat, he admitted he had only been reading
the newsgroup for *FOUR DAYS*.

30-day read-only might not be a bad idea for ALL users. You seem to forget
that you were once young and in college and prefer to act like a grumpy,
disillusioned grownup. I hate to think what your kids are like (Daddy,
why is the sky blue.... AARRGGHHH!!!)

And really, posting non-scientific "poll" results showing how everyone
on the net "supports" you? Get a life...

But what do I know...

Well I went to the ham fest in Wichita and spent more than I intended to. I bought this Alinco 560 T and wonder what all the neat things it can do that are not in the manual. I know how to do the out of band xmit mod. What interests me is expanding the receive capabilities.

Also picked up a Heath 101 transceiver.

Thanks Gordon N5QAQ

I don't believe it for a minute. Anyone who speaks to new amateurs
with the kind of profanity and outrageously unhospitable (and in my
experience over these past fifteen years, decidedly un-amateurlike)
manner certainly didn't receive the marked show of support this fellow
claims. This looks like a transparently poor attempt at putting a
good face on shot credibility. Good try.

3474. NEEDED: Info on DisCone antenna:AS3886/TRC191

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-06 19:31:41 UTC
From: ka2raf@ka2qhd.UUCP
Message-ID: <505@ka2qhd.UUCP>
Source record: 292845
Cross-posted to: rec.radio.shortwave,rec.radio.swap,rec.radio.amateur.misc

I went to the Deerfield hamfest the weekend(THE GREATEST!) and I found a source of military man-pack discones in new condition. The dealer had stated they were 30-100 MHz. I wonder if anyone could give me info on the specs on this antenna. The following is from the builders plate:

ANTENNA RADIO ACCESS AS3886/TRC191
DES.ACT FSCM 87032 P/N 01-2731075
MFR FSCM 57010 P/N 879379
CONTRACT # DAAB07-86-C-K022
NSN-5980-01-253-6851
US

THEN A GTE WARRANTY LABEL:
05225393 WITH BAR CODE

I would like any info you can provide out there about the antenna or the TRC191 system and its frequency ranges (possible freqs of course).

the rod dimensions are TOP Cone: 6 X 35"
BOT.Cone: 6 X 101"
it folds in a 36" canvas pack with shoulder strap
what freqs does those dimensions figure to be?
any help would be appreciated, I can get one for anyone who wants one.
Thank you de Chris

>a whole lot less than 50 ohms.
>

I'm sure everyone else will follow up on this but I will anyway!
The impedance of a transmission line is defined as the impedance of
an INFINATELY long line with inductance/resistance/capacitance/conductance
per unit length (distributed). Now you can simulate an infinite line
by taking a finite length of line (0 to X metres) and terminating it
with its charcteristic impedance. Which is like puting two pieces of
line 0 to X and X to infinity in series. This if we shorten a 50
transmission line from 0 to infinity to a line 0 to X terminated in 50ohms
then it still looks like 50 ohms from DC to Daylight. If you just
take a short piece of transmission line you must apply the Telegrapher's
equation to the load and transmission line to determine the impedance
looking into the line. Thus (using a smith chart) if your load is
an open circuit at DC you dont move any where on the smith chart and
what you see with any cable is an open circuit. When you move up
in frequency to a point where the length of the cable becomes closer
to the wavelength, then the impedance seen will go from an infinate
capacitive reactance to an infinite inductive reactance through 0 and
so on.

3476. New Icom SRA series single band HTs

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-07 01:47:55 UTC
From: sdkuo@argo.acs.oakland.edu
Message-ID: <10435@vela.acs.oakland.edu>
Source record: 292851

When I read this months issue of 73, I saw an ad for Icom's new SRA series of single band HTs (the 2SRA, 2 meters, and 4SRA, 70 cm). These HTs look just like the W2A, but can only transmit on 2 meters. But also included is dual VFO receive on 25-902 MHz (supports Wide mode FM too). It appears to come with 2 antennas that attach to 2 BNC connectors. It bosts the regular features that Icom offers and has 96 memory channels.

Has anyone seen or used one of these? Since they are advertising it as a wide band receiver, does it do a better job of receiving than the W2A (after the light+B+#+on trick)? It does look a little weird having two antennas.

Steve Kuo, N8OPH, sdkuo@oakland.edu

3477. ICOM IC-2410 mods

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-07 03:10:23 UTC
From: ker@cbnewsj.cb.att.com
Message-ID: <1991Oct7.031023.4559@cbnewsj.cb.att.com>
Source record: 292841

In addition to a previous posting concerning changing the display I thought I would share info on:

1.) Extending the receive range
2.) Adding an 800 Mhz antenna input
3.) Cross-band repeat instructions (local and via remote control)

EXPANSION OF RECEIVE RANGE

The following diodes are located on the Logic Unit circuit board. The Logic Unit circuit board sits behind the front panel of the radio. To get to the board remove the top and bottom of the case. Now notice that the front section of the radio is a separate unit from the main body of the radio. Remove the 4 screws holding the sections together but do not yet separate the sections. Place the radio on a table so that it is right side up. Carefully start to separate the sections being careful of ribbon cables that connect the front section of the radio to the rear. If you look at the back of the circuit board on the front section towards the lower part of the radio, you will clearly see three glass diodes labeled D8, D9 and D10. You will know this is the right circuit board because a lithium battery will be taped to it. These are the diodes to cut to get extended receive range as follows:

D8 320-399, 830-950 800 Mhz coverage requires new antenna input
D9 118-135
D10 400-479

800 MHZ ANTENNA INPUT
To receive 800 Mhz you need to add a new antenna input to connector J2 on the MAIN-B unit (UHF unit) which is the large circuit board on the bottom of the radio. J2 connects to a the B-band board which is a very small daughterboard, that is connected to the MAIN-B board. The service manual offers no description of this board but it apparently is the 800 Mhz front end.

Two parts are needed:
One 5 3/4" grey coax jumper (this is available from ICOM but it doesn't have a part number)

Either:
One OPC223 pigtail with UHF connector
or
One OPC166 pigtail with N connector

The grey coax jumper has a plug on one end that mates with J2 and bare leads on the other. The pigtail also has two bare leads on one end. This same end also has a metal flange thats designed to screw onto the

back panel of the radio after removing one of the dummy caps on either side of the existing antenna pigtail.

Without going into too much detail, you must:

Remove the small metal cap nearest the bottom of the radio and next to the existing pigtail.

Remove the metal shield at the back section of the Main-B unit.

Solder the two pieces of coax together, shield to shield, center to center and screw this assembly on to the back panel.

Plug the grey cable into J2 and then reassemble the radio.

CROSS-BAND REPEAT (An edited version from an ICOM info sheet)

1.) Set frequencies for both UHF and VHF. If necessary, set transmit offset and tone.

2.) Hold the "BAND" switch and the "SET" switch. The memory number display will flash the letter "L". This indicates the 2410 is in the "Mini Repeater" mode.

3.) Transmission by PTT is possible. If PTT is operated, the band which is indicated by the flashing decimal point will be transmitted on. This can be done even when in "Mini Repeat" mode. In other words, PTT has priority over the "Mini Repeat" operation.

Transmitted band will be switched by the "UP" or "DN" key on the microphone. The flashing decimal point will indicate which band will be transmitted on.

4.) Mini Repeater function will remain even when power is turned off. To disable repeater function, hold the "SET" key until the flashing "L" disappears.

REMOTE CROSS-BAND ACTIVATION
To activate cross-band repeat remotely: after dialing "B", optional 3 digit code then "#", the command for cross-band repeat on is "B", "D", "*".

To turn off repeat, dial "B", optional 3 digit code, then "#".

DISCLAIMER: Proceed at your own risk. I assume no responsibility if any info posted here causes your radio harm.

I came across some material on the preamp & mixer of the FT1000 in RADCOM a month ago. It looks quite sensible. I understand that the same design is used in the FT990. The FT1000 sports dual receivers and so splits the RF into seperate front ends. Splitters have loss, this cannot be overcome without some sacrifice of usable dynamic range. So I expect that the 990 should have an advantage over the 1000. (and the IC765 over the IC781).

After trying the various contenders, I bought a '765. Who needs 2 receivers? with millisecond QSY I can sneak a quick look elsewhere should I want. At least the FT 1000 gives stereo audio so you can decide which freq which signal was heard on.

Eddy,

Unfortunately I don't think that you're going to be able to get them to buy it.. If you got pulled over with 2 other cars what probably happened is that the Radar picked up the vehicle with the biggest radar cross section and used that for the reading it gave the officer. The police are pretty careful to keep their radar up to date and accurate just so people they pull over don't go around claiming that it was inaccurate. However if you do feel that the instrument was incorrect or was 'desensed' by your 2m radio go right ahead and bring it up. Although desensing is caused by a transmitter at a close frequency.. ie: a receiver at 146.91 being desensed by someone nearby talking on the input..146.31.. I don't think that the primary frequency would desense a radar gun (10GHz) and Kenwood wouldn't let a radio out that had a significant harmonic that far down the band..

If I am wrong about any of this please let me know.. This is information that I have gathered around the group and from conversations with people in Erie and St. Lawrence county and is likely to be in err.

'73 and good luck!

-Paul

P.S. If you're really lucky the 'procecutor' might miscalculate the speed that you were going like he did for me.. I got off with a parking ticket for doing ~17 over.. It was my first time as well..

3484. How to find frequencies on UHF Airband.

Newsgroup: rec.radio.amateur.misc
Date: 1991-10-07 11:41:18 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <07.Oct.91.12
Source record: 292802

Someone asked recently how to go about finding frequencies used on the
Military air-band, remembering that it covers such a massive frequency
range and transmissions are usually short duration.
The biggest problem is that an average scanner stays on each frequency
for such a short time that the probability of hearing anything is usually
very low when considering the range of frequencies to scan.
My way is to borrow a spectrum-analyser and hook it to an antenna, then on
maximum sensitivity, make it sweep the relevant band. Transmissions show up
clearly, you can then use the cursor to locate their frequency within a
few hundred khz, then reach for your scanner. A spectrum analyser with an
AM demodulator can be used to feed a small audio amp & speaker, but usually
they are too drifty to stay on-frequency for long.
After a while you can get to identify the different transmissions by their
shape and duration as they show up on the screen, so you can weed out all
the curious radar/telemetry crud and only bother with the audio.
Its also a nifty way of finding out where they go to when they use
'tactical' channels rather than specifying the frequencies. Using an
ordinary scanner can be frustrating when they suddenly say 'go to
channel B' and you are left with 175MHz of scanning before you find
where they went...
You can power a spectrum-analyser off a 12v truck battery, using
